

Introduction to Programming with Scientific Applications

Gerth Stølting Brodal
Department of Computer Science
Aarhus University

Course evaluation
*“The first lecture was intimidating
and overwhelming”*

Lecturer

Name	Gerth Stølting Brodal
Research	Algorithms and Data Structures (Computer Science)
Teaching	
2018 -	BSc course on Introduction to Programming with Scientific Applications
2003 -	BSc course on Introduction to Algorithms and Data Structures
1999 - 17	MSc courses on Computational Geometry, Algorithm Engineering, Advanced Data Structures, External Memory Algorithms and Data Structures
Python	Advanced Beginner

Course description – kursuskatalog.au.dk/en/course/138411/

Introduction to Programming with Scientific Applications

Description of qualifications

After the course the participants will have knowledge of principles and techniques for systematic **construction of programs**.

At the end of the course, the participants will be able to:

- apply constructions of a common programming language,
- develop **well-structured** programs and perform **testing** and **debugging** of these,
- explain fundamental programming concepts and basic algorithmic techniques,
- apply standard **tools for scientific applications**,
- use the documentation for a programming language and available software packages.

Contents

The course gives an introduction to programming with scientific applications.

Programming concepts and techniques are introduced using the **Python** programming language.

The programming concepts are **illustrated in other programming languages**. The following content is included.

Basic programming constructs: Data types, operators, variables, flow of control, conditionals, loops, functions, recursion, scope, exceptions. *Object orientation:* Abstract data types, classes, inheritance, encapsulation. *Basic algorithmic techniques:* Sorting, binary search, dynamic programming. *Systematic development of programs:* Testing and debugging. File-based input/output, numerical analysis, functional programming. Scientific computing using standard packages for Python.

ECTS 10

Hours - weeks - periods

Lectures 2 x 2 hours/week

TA sessions 1 x 3 hours/week

Study café 3 x 1 hour/week

Language of instruction

Danish

Instructor

Gerth Stølting Brodal

Academic prerequisites

(Some) Linear algebra

Exam

5 hour programming

Aid: Computer without Internet, no AI

7-point grading scale

Prerequisites for examination participation

Submission and approval of 10 mandatory assignments and submission of

1 implementation project

Notes Grade reflects an overall assessment of implementation project and written examination. Project counts 20% and written exam counts 80%

Question – Primary education?

- a) Mathematics
- b) Mathematics-Economics
- c) Data Science
- d) Chemistry
- e) Physics
- f) Other Science-Technology
- g) Other

Question – Programming languages you know?

+750 listed on en.wikipedia.org/wiki/List_of_programming_languages

Question – Programming experience?

For the programming language you know best (if any) please state your proficiency level within the language.

- a) None
- b) Fundamental awareness (basic knowledge)
- c) Novice (limited experience)
- d) Intermediate (practical application)
- e) Advanced (applied theory)
- f) Expert (recognized authority)

Some course practicalities

Course page on Brightspace and GitHub

gsbrodal.github.io/ipsa

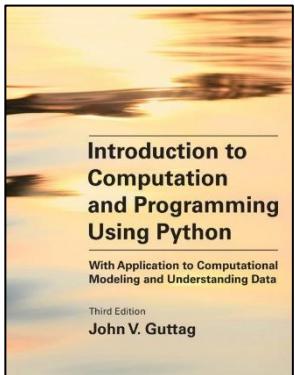

The screenshot shows a comparison between a Brightspace course page and a GitHub page for the same course. The GitHub page is a static website for the course "Introduction to Programming with Scientific Applications" offered by Aarhus University, Department of Computer Science. It includes:

- A header with the course title and a Python code snippet.
- A "Welcome" section with a brief introduction and the lecturer's name, Gerth Stølting Brodal.
- A "Course content" section with a detailed outline of topics covered in the course.
- A portrait photo of the lecturer, Gerth Stølting Brodal.

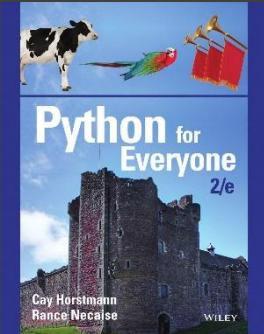

The Brightspace course page on the left shows the course navigation menu, including "Course information", "Who, where and when", "Handin deadlines", and "Course content on GitHub". The "Course content on GitHub" link is highlighted with a blue border, indicating it is the active tab or a related resource.

Course text book – optional

John V. Guttag: **Introduction to Computation and Programming Using Python, Third Edition With Application to Computational Modeling and Understanding Data.** Third Edition. 664 pages. MIT Press, 2021.

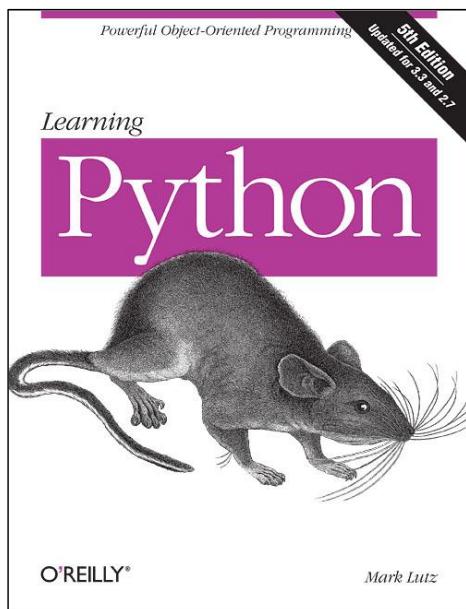

- *[Guttag, 2nd Ed., page 8] "The reader should be forewarned that this book is by no means a comprehensive introduction to Python". 3rd Ed. added about 80 pages on introduction to Python.*
- *Covers all basic features of Python enabling you to deal with data in Chapters 1-10 (212 pages) - remaining chapters are applications*
- *Other resources: Google, stackoverflow, Python.org, YouTube, Als...*

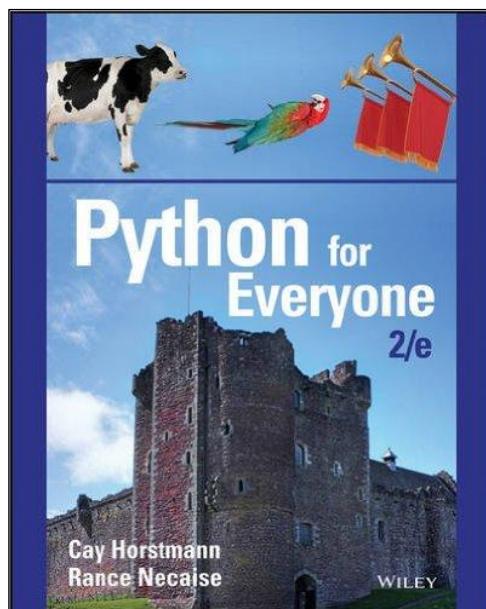

Comparison to a standard text book on the *programming language* Python by Cay Horstmann and Rance Necaise:

Topic **recursion** is covered by Guttag on page 123 (2nd edition on page 50), Horstmann and Necaise do it on page 611

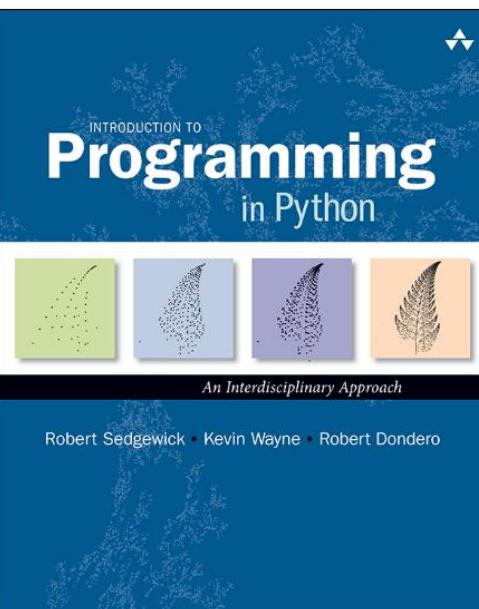

Some other books on Python

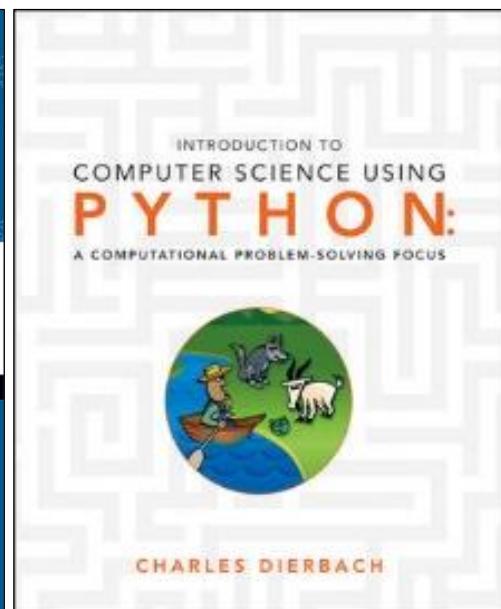

O'Reilly, 2013
1684 pages

Two Python programs

A Python program

Python shell

```
> x = 7
> print(x * x)
| 49
```

Memory

- 7 is an *integer literal* – in Python denoted an “int”
- x is the name of a *variable* that can hold some value
- = is assigning a value to a variable
- * denotes multiplication
- print is the name of a built-in *function*,
here we call print to print the result of $7 * 7$
- A program consists of a sequence of *statements*, executed sequentially

Question – What is the result of this program?

```
Python shell
> x = 3
> y = 5
> x = 2
> print(x * y)
```

x assigned new value

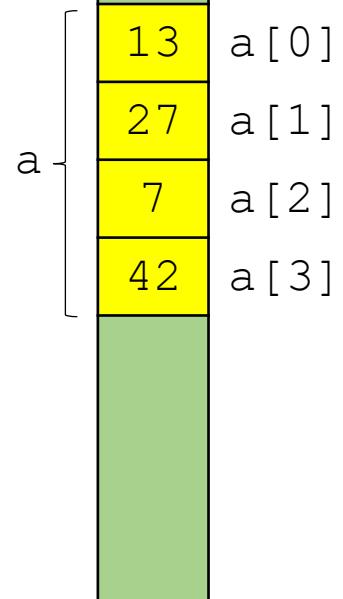

- a) 10
- b) 15
- c) 25
- d) [15, 10]
- e) Error
- f) Don't know

Another Python program using lists

Python shell

```
> a = [13, 27, 7, 42]
> print(a)
| [13, 27, 7, 42]
> print(a[2])
| 7
```

Memory

- `[13, 27, 7, 42]` is a *list* containing four integers
- `a[2]` refers to the entry in the list with *index 2*
(the first element has index 0, i.e. `a[2]` is the 3rd element of the list)
- Note that `print` can also print a list

Question – What is the result of this program?

Python shell

```
> a = [3, 5, 7]
> print(a[1] + a[2])
```

- a) 8
- b) 10
- c) 12
- d) 15
- e) Don't know

Why Python ?

the next slides will be technical

TIOBE Index January 2026

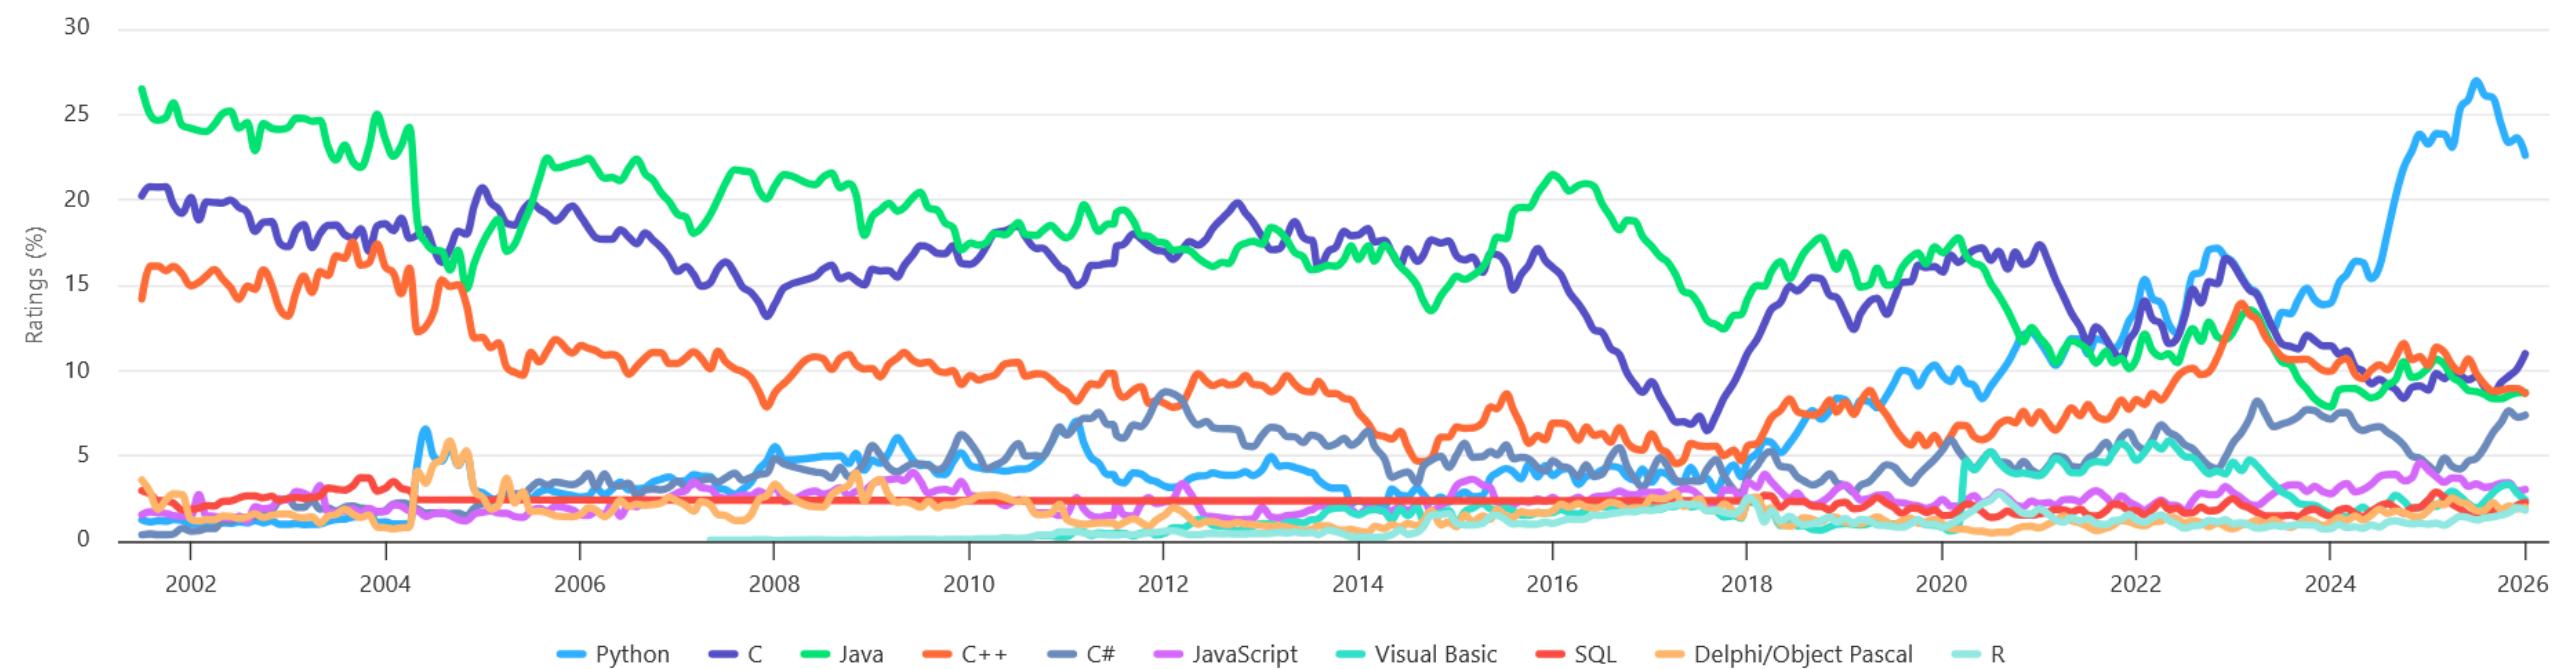

Jan 2026	Jan 2025	Change	Programming Language	Ratings	
1	1		Python	22.61%	-0.61%
2	4		C	10.99%	+2.13%
3	3		Java	8.71%	-1.44%
4	2		C++	8.67%	-1.62%
5	5		C#	7.39%	+2.94%
6	6		JavaScript	3.03%	-1.17%
7	9		Visual Basic	2.41%	+0.04%
8	8		SQL	2.27%	-0.14%
9	11		Delphi/Object Pascal	1.98%	+0.19%
10	18		R	1.82%	+0.81%

The TIOBE Programming Community index is an indicator of the **popularity of programming languages**. The index is updated once a month. The ratings are based on the number of skilled engineers world-wide, courses and third party vendors. Popular search engines such as Google, Bing, Yahoo!, Wikipedia, Amazon, YouTube and Baidu are used to calculate the ratings. It is important to note that the TIOBE index is not about the *best* programming language or the language in which *most lines of code* have been written.

Popularity of programming languages

TIOBE Programming Community Index

Source: www.tiobe.com

“Hello World”

- In Java, C, C++ a lot of “{”, “}” and “;” are needed
- Java tends to have a lot of “public...” details that need to be spelled out
- Python is concise

Java

```
public class HelloWorld {  
    public static void main( String[] args ) {  
        System.out.println( "Hello World!" );  
        System.exit( 0 );  
    }  
}
```

C

```
#include <stdio.h>  
  
int main(int argc, char **argv) {  
    printf("Hello World");  
    return 0;  
}
```

C++

```
#include <iostream>  
using namespace std;  
  
int main(int argc, char** argv) {  
    cout << "Hello, World!";  
    return 0;  
}
```

Python 2

```
print "Hello world"
```

Python 3

```
print("Hello world")
```

Why Python ?

- Short concise code

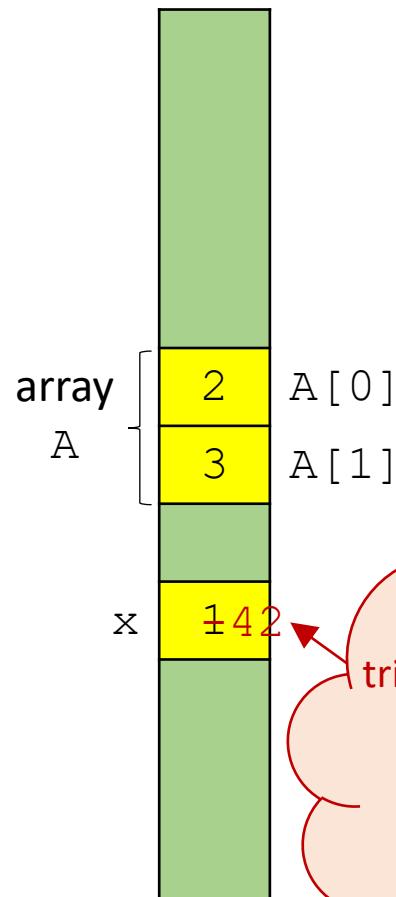

(C developed by Dennis Ritchie 1969-73)

C index out of bounds

Debugging is the process of finding and resolving defects or problems within a computer program that prevent correct operation of computer software or a system.

en.wikipedia.org/wiki/Debugging

Memory

"A" only has size 2, but tries to update the 4th entry.
No warning is giving.
Something unexpected is overridden in memory.
Have fun debugging!

indexing.c

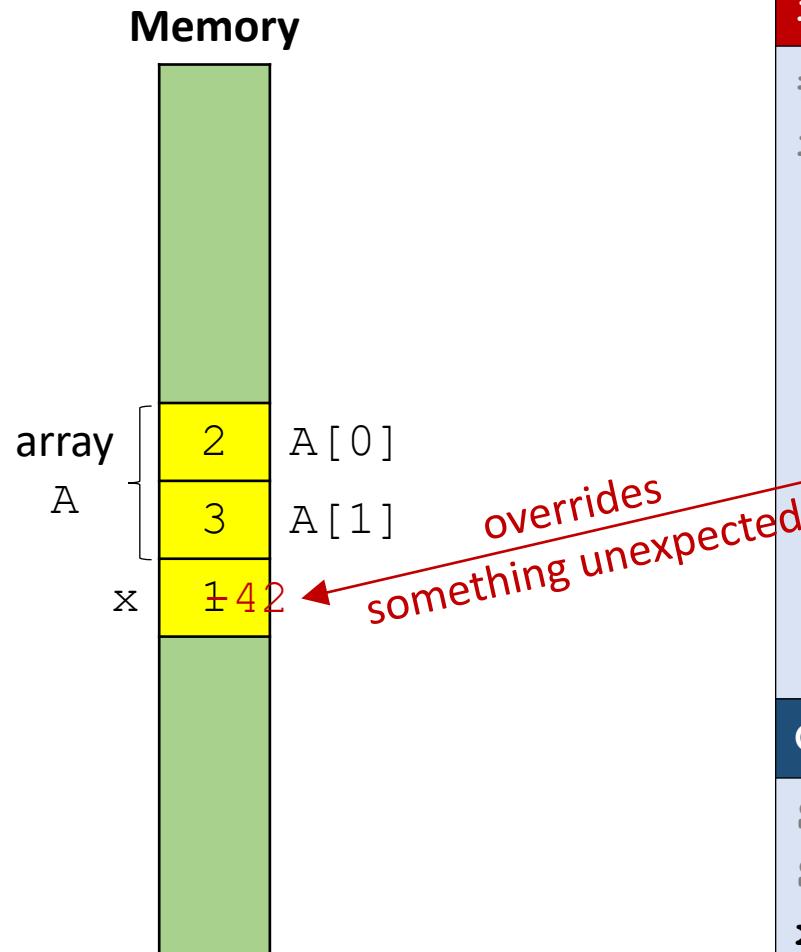

```
#include <stdio.h>
int main() {
    int x = 1;
    int A[2] = {2, 3}; // A[0] = 2, A[1] = 3
    printf("x = %d, A = {%d, %d}\n", x, A[0], A[1]);
    A[3] = 42; // index A[3] out of bounds
    printf("x = %d, A = {%d, %d}\n", x, A[0], A[1]);
    return 0;
}
```

Output

```
$ gcc indexing.c
$ ./a.exe
x = 1, A = {2, 3}
x = 42, A = {2, 3}
```

Skipping checking for invalid indexing makes programs faster,
but also requires disciplined programming

... and C++ index out of bounds

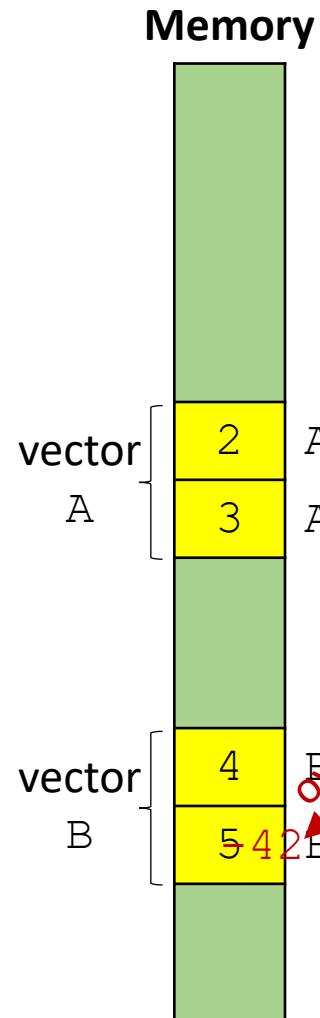

indexing.cpp

```
#include <iostream>
int main() {
    int x = 1;
    int A[2] = {2, 3}; // A[0] = 2, A[1] = 3
    std::cout << "x = " << x << ", A = {" 
                  << A[0] << ", " << A[1] << "}" << std::endl;
    A[2] = 42; // index A[2] out of bounds
    std::cout << "x = " << x << ", A = {" 
                  << A[0] << ", " << A[1] << "}" << std::endl;
    return 0;
}
```

Output

```
$ g++ indexing.cpp
$ ./a.exe
x = 1, A = {2, 3}
x = 42, A = {2, 3}
```

... and C++ vector index out of bounds

indexing.cpp

```
#include <iostream>
#include <vector>

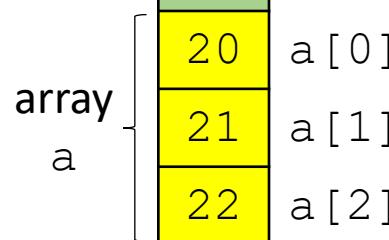

int main() {
    std::vector<int> A = {2, 3}; // A[0] = 2, A[1] = 3
    std::vector<int> B = {4, 5}; // B[0] = 4, B[1] = 5
    std::cout << "A={" << A[0] << ", " << A[1] << "}, ";
    std::cout << "B={" << B[0] << ", " << B[1] << "}" << std::endl;
    A[9]=42; // index A[9] out of bounds
    std::cout << "A={" << A[0] << ", " << A[1] << "}, ";
    std::cout << "B={" << B[0] << ", " << B[1] << "}" << std::endl;
    return 0;
}
```

Output

```
$ g++ -std=c++11 indexing-vector.cpp
$ ./a.exe
A={2, 3}, B={4, 5}
A={2, 3}, B={4, 42}
```

... and Java index out of bounds exception

Memory

indexing.java

```
class IndexingTest{
    public static void main(String args[]) {
        int a[] = {20, 21, 22};
        a[5] = 42; // index a[5] out of bounds
    }
}
```

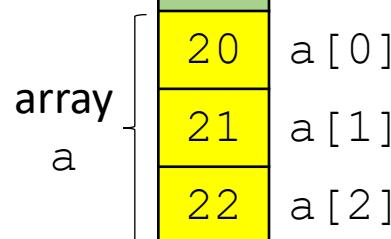

Output

```
$ javac indexing.java
$ java IndexingTest
Exception in thread "main"
java.lang.ArrayIndexOutOfBoundsException: 5
        at IndexingTest.main(indexing.java:5)
```

Java provides error message when running the program

... and Python index out of bounds exception

Memory

indexing.py

```
a = [20, 21, 22]
a[5] = 42 # index a[5] out of bounds
```

Output

```
$ python indexing.py
Traceback (most recent call last):
  File "indexing.py", line 3, in <module>
    a[5] = 42
IndexError: list assignment index out of range
```

Python provides error message when running the program

Memory safety

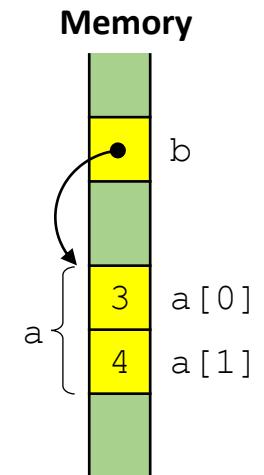

The White House 2024 | Press Release: “Future Software Should Be Memory Safe” (www.whitehouse.gov)

National Security Agency 2022 | Cybersecurity Information Sheet: Software Memory Safety (media.defense.gov)

- C and C++ are flexible but **memory unsafe** programming languages
 - Unintended writes or reads to memory can be exploited by malicious cyber actors 
- Python, Java, Rust are examples of memory safe languages
- Rust aims at achieving the efficiency of C by slightly restricting flexibility

`indexing.rs`

```
fn main() {
    let mut a = [3, 4];
    a[2] = 7; // Compile error: this operation will panic at runtime
    for i in 2..3 { a[i] = 7 } // Run-time panic: index out of bounds
    let b = &mut a;
    a[1] = 6; // Compile error: cannot use `a` because it was mutably borrowed
    (*b)[0] = 5;
    for i in 0..2 { println!("a[{}] = {}", i, a[i]) }
}
```

Why Python ?

- Short concise code
- **Index out-of-range exceptions**

C++ different ways to print a vector

vector-iterator.cpp

```
#include <iostream>
#include <vector>
int main() {
    // Vector is part of STL (Standard Template Library)
    std::vector<int> A = {20, 23, 26};
    // "C" indexing - since C++98
    for (int i = 0; i < A.size(); i++)
        std::cout << A[i] << std::endl;
    // iterator - since C++98
    for (std::vector<int>::iterator it = A.begin(); it != A.end(); ++it)
        std::cout << *it << std::endl;
    // "auto" iterator - since C++11
    for (auto it = A.begin(); it != A.end(); ++it)
        std::cout << *it << std::endl;
    // Range-based for-loop - since C++11
    for (auto e : A)
        std::cout << e << std::endl;
}
```

elegant

Java - different ways to print a vector

vector-iterator.java

```
import java.util.Vector;
import java.util.Iterator;

class IteratorTest{
    public static void main(String[] args) {
        Vector<Integer> a = new Vector<Integer>();
        a.add(7);
        a.add(42);
        // "C" for-loop & get method
        for (int i = 0; i < a.size(); i++)
            System.out.println(a.get(i));
        // iterator
        for (Iterator it = a.iterator(); it.hasNext(); )
            System.out.println(it.next());
        // for-each loop - since Java 5
        for (Integer e : a)
            System.out.println(e);
    }
}
```

elegant

The Python way to print a list

print-list.py

```
a = [20, 23, 26]

for e in a:
    print(e)
```

Output

```
$ python print-list.py
20
23
26
```

Why Python ?

- Short concise code
- Index out of range exceptions
- **Elegant for-each loop**

```
$ g++ -std=c++11 print-vector.cpp
cpp-error-message.cpp: In function 'int main()':

```

C++ how not to print a vector

print-vector.cpp

```
#include <iostream>
#include <vector>

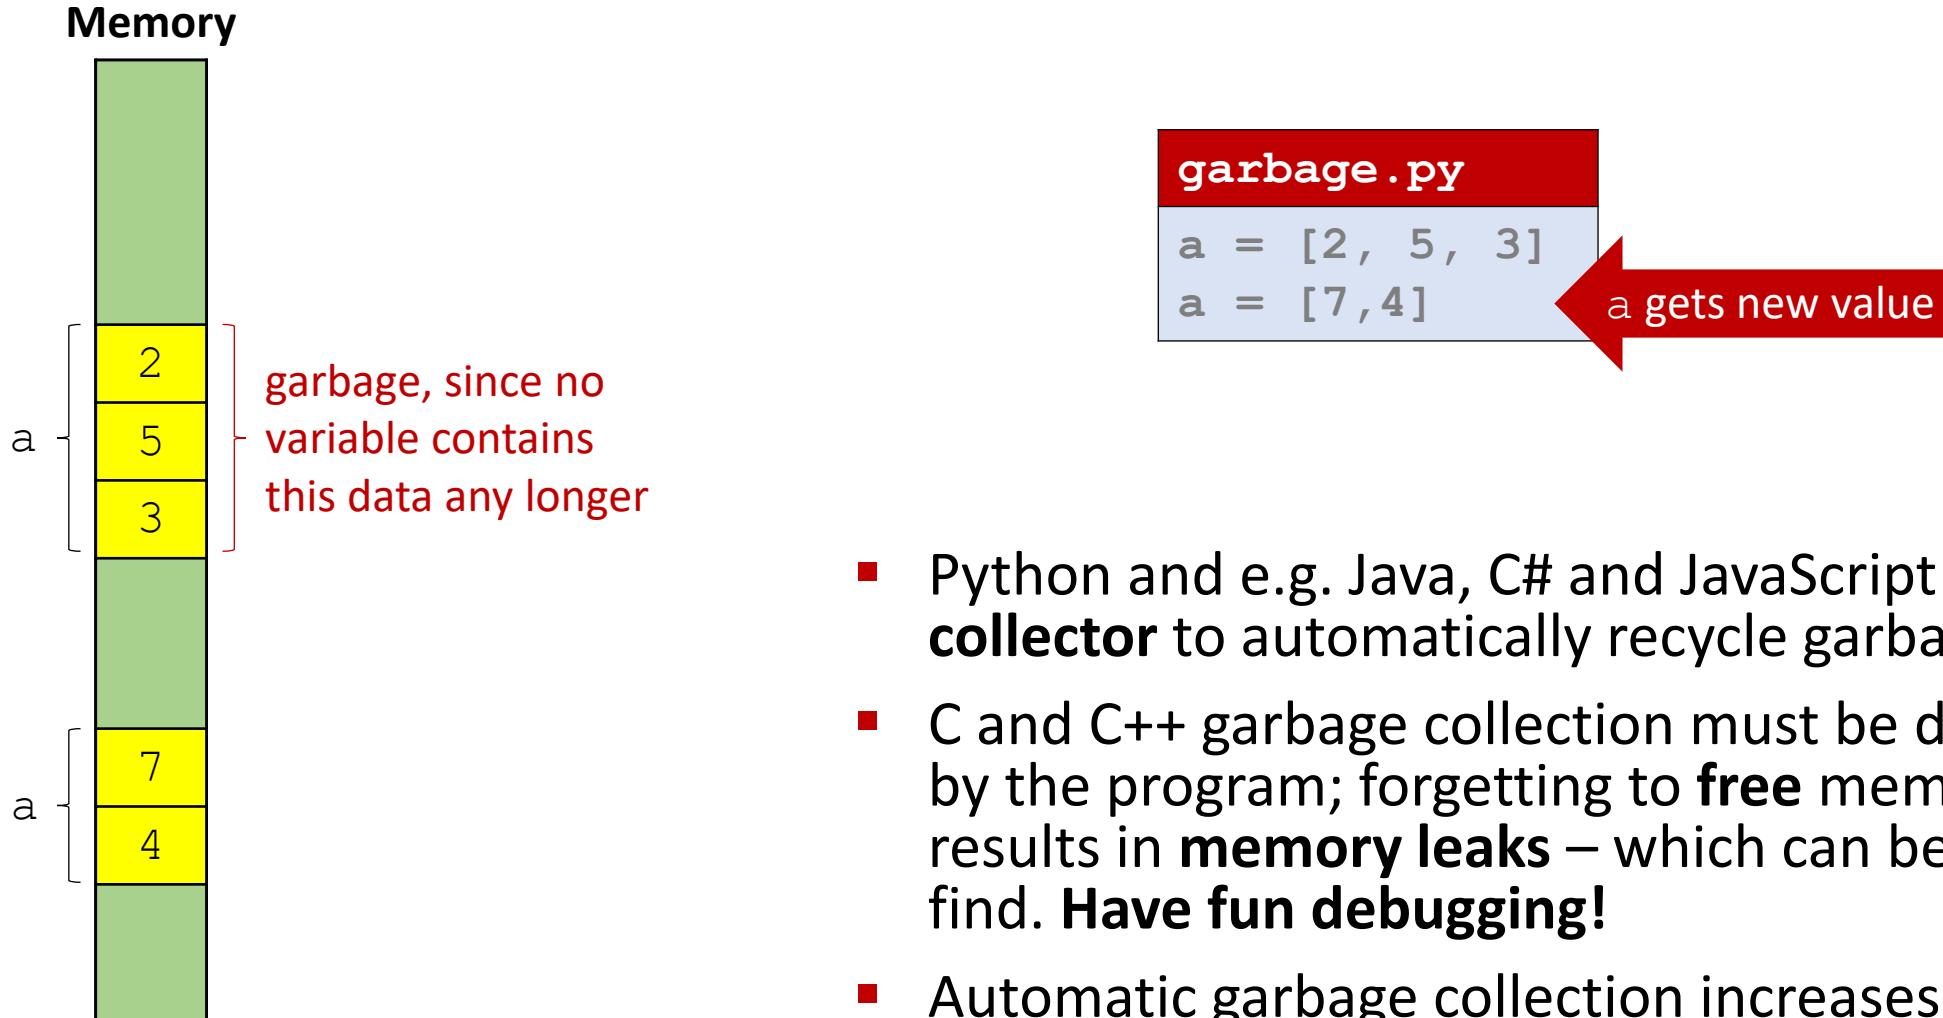

int main() {
    std::vector<int> A = {2, 3};
    std::cout << A << std::endl;
    return 0;
}
```

C++ vectors cannot be printed directly –
mistake results in +200 lines of error messages

Why Python ?

- Short concise code
- Index out of range exceptions
- Elegant for-each loop
- **Python hopefully better error messages than C++**

Python and garbage collection

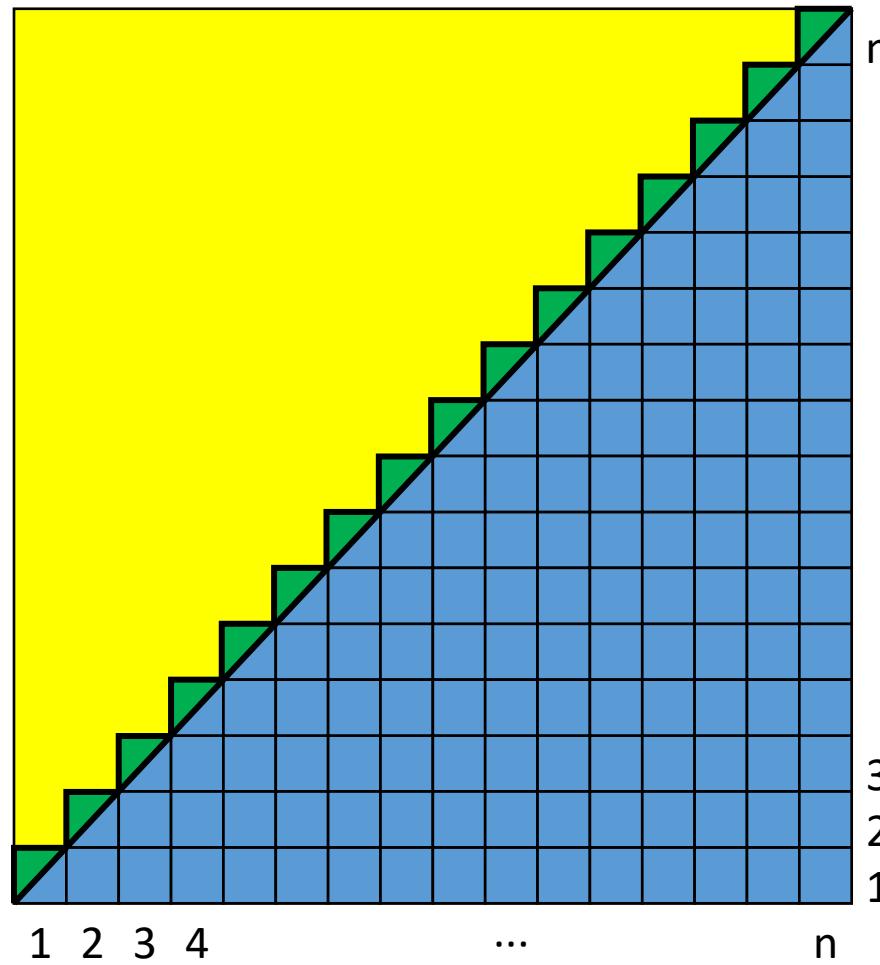

Why Python ?

- Short concise code
- Index out of range exceptions
- Elegant for-each loop
- Python hopefully better error messages than C++
- **Garbage collection is done automatically**

Python performance vs C, C++ and Java

Compute sum $1 + 2 + 3 + \dots + n = \frac{n^2}{2} + \frac{n}{2}$

$$1 + 2 + \cdots + n$$

add.py

```
import sys

n = int(sys.argv[1])
sum = 0
for i in range(1, n + 1):
    sum += i
print("Sum =", sum)
```

add.c

```
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char *argv[]) {
    int n = atoi(argv[1]);
    int sum = 0;
    for (int i = 1; i <= n; i++)
        sum += i;
    printf("Sum = %d\n", sum);
}
```

add.cpp

```
#include <iostream>
#include <cstdlib>
using namespace std;

int main(int argc, char *argv[]) {
    int n = atoi(argv[1]);
    int sum = 0;
    for (int i = 1; i <= n; i++)
        sum += i;
    cout << "Sum = " << sum << endl;
}
```

add.java

```
class Add{
    public static void main(String args[]){
        int n = Integer.parseInt(args[0]);
        int sum = 0;
        for (int i = 1; i <= n; i++)
            sum += i;
        System.out.println("Sum = " + sum);
    }
}
```

Timing results

n	C (gcc 9.2)	C++, int (g++ 9.2)	C++, long (g++ 9.2)	Java (12.0)	CPython (3.8.1)	PyPy (7.3.0)	Numba, int64
10^7	0.001 sec*	0.001 sec*	0.003 sec	0.006 sec*	1.5 sec	0.27 sec	0.002 sec
10^9	0.10 sec**	0.10 sec**	0.30 sec	0.40 sec**	145 sec	27 sec	0.2 sec**

Wrong output (overflow)

* -2004260032 instead of 50000005000000

** -243309312 instead of 5000000050000000

- since C, C++, and Java only uses 32 bits to represent integers (and 64 bits for "long" integers)

Bit position	6666666665555555444444443333333332222222211111111000000000 987654321098765432109876543210987654321098765432109876543210
bin(10**9)	11101110011010110010100000000
bin(50000005000000)	101101011100110001000100101101011010000000
bin(-2004260032+2**32)	100010001000100101101011010000000
bin(5000000050000000)	11011100001011010110011110010110010100000000
bin(-243309312+2**32)	1111000101111110110010100000000

Timing results

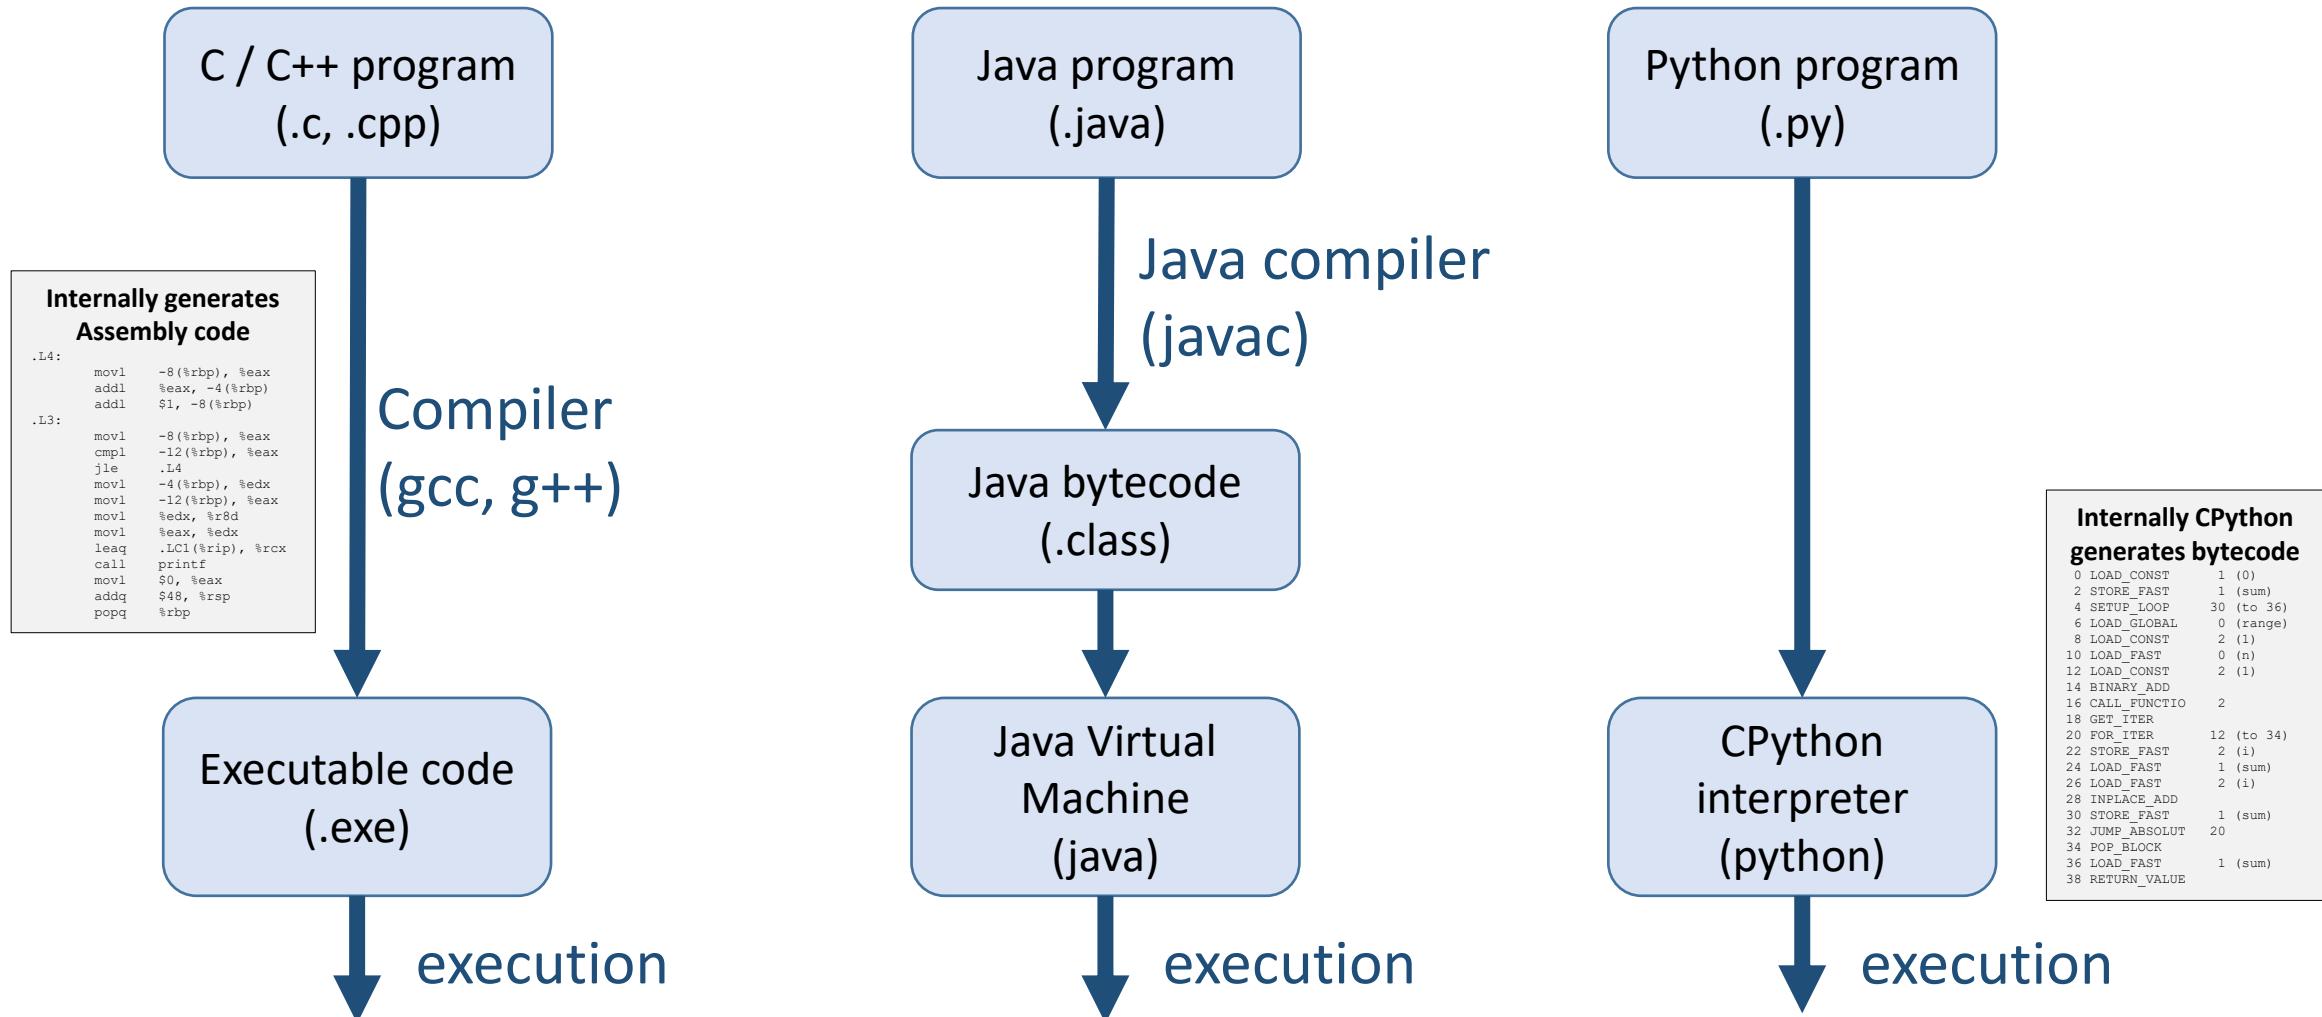

n	C (gcc 9.2)	C++, int (g++ 9.2)	C++, long (g++ 9.2)	Java (12.0)	CPython (3.8.1)	PyPy (7.3.0)	Python
10^7	0.001 sec*	0.001 sec*	0.003 sec	0.006 sec*	1.5 sec	0.27 sec	0.002 sec
10^9	0.10 sec**	0.10 sec**	0.30 sec	0.40 sec**	145 sec	27 sec	0.2 sec**

- Relative speed

C ≈ C++ > Java >> Python

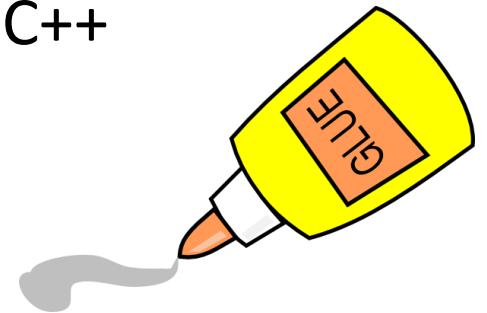

- C, C++, Java need to care about integer overflows – select integer representation carefully with sufficient number of bits (8, 16, 32, 64, 128)
- Python natively works with arbitrary long integers (as memory on your machine allows). Also possible in Java using the class `java.math.BigInteger`
- Python programs can (sometimes) run faster using PyPy
- Number crunching in **Python** should be delegated to **specialized modules (e.g. Numpy, CPLEX, Numba)** – often written in C or C++ and requires selecting right integer representation

Interpreter vs Compiler

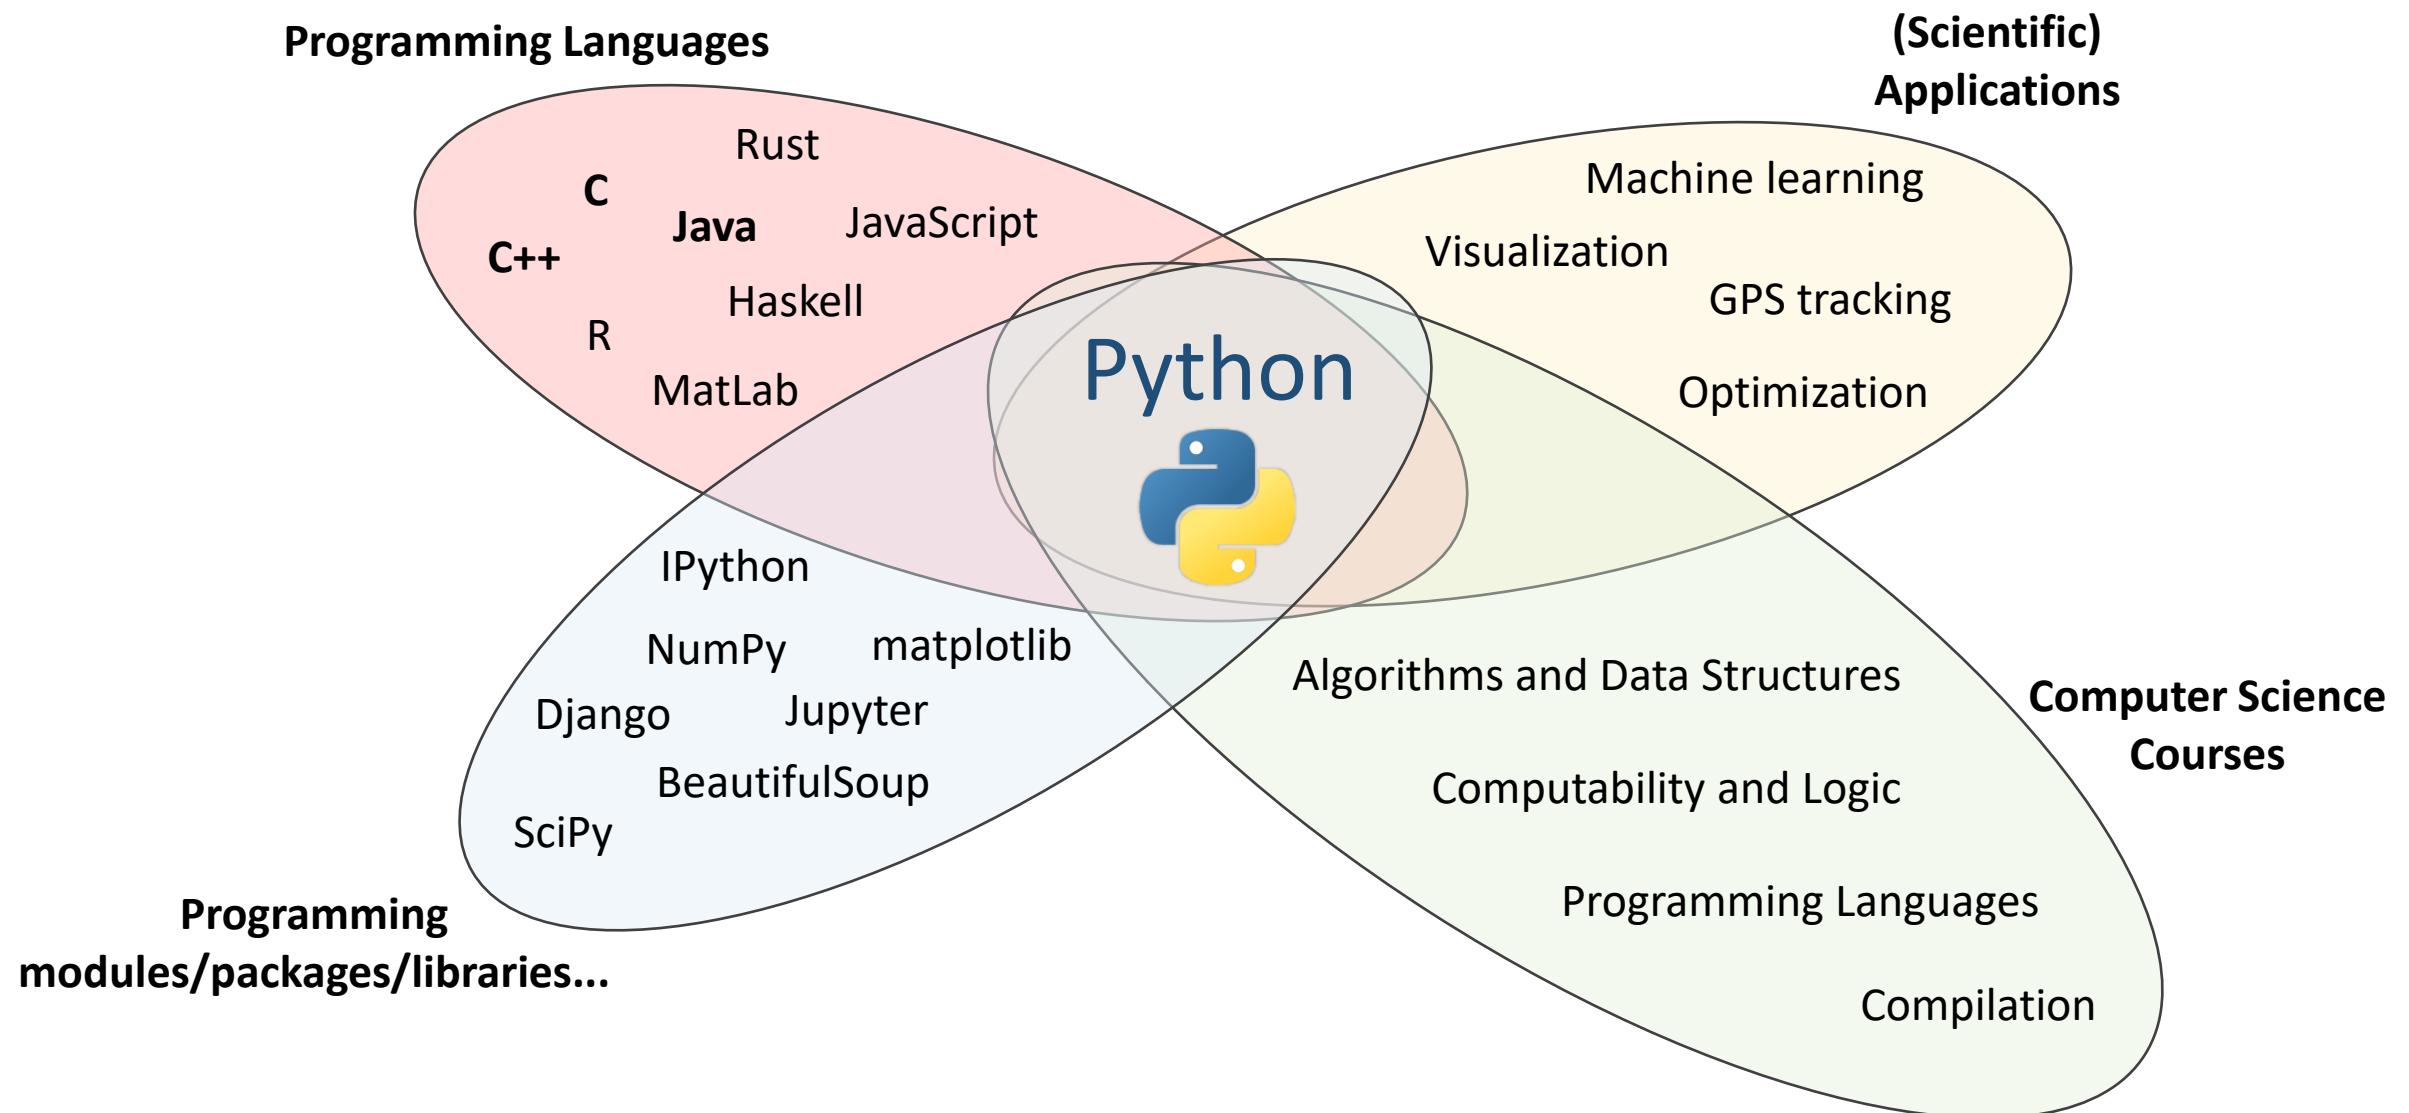

Why Python ?

- Short concise code
- Index out of range exceptions
- Elegant for-each loop
- Python hopefully better error messages than C++
- Garbage collection is done automatically
- **Exact integer arithmetic (no overflows)**
- **Can delegate number crunching to C, C++, ...**

This course

Course overview

Basic programming
Advanced / specific python
Libraries & applications

1. Introduction to Python	10. Functions as objects	19. Linear programming
2. Python basics / if	11. Object oriented programming	20. Generators, iterators, with
3. Basic operations	12. Class hierarchies	21. Modules and packages
4. Lists / while / for	13. Exceptions and files	22. Working with text
5. Tuples / comprehensions	14. Doc, testing, debugging	23. Relational data
6. Dictionaries and sets	15. Decorators	24. Clustering
7. Functions	16. Dynamic programming	25. Graphical user interfaces (GUI)
8. Recursion	17. Visualization and optimization	26. Java vs Python
9. Recursion and Iteration	18. Multi-dimensional data	27. Final lecture

10 handins
1 final project (last 1 month)

History of Python development

- Python created by Guido van Rossum in 1989, first release 0.9.0 1991
- Python 2 → Python 3 (clean up of Python 2 language)
 - Python 2 – version 2.0 released 2000, final version 2.7 released mid-2010
 - Python 3 – released 2008, current release 3.14.2
- Python 3 is *not* backward compatible, libraries incompatible

Python 2	Python 3
print 42	print(42)
int = C long (32 bits)	int = arbitrary number of digits (= named “long” in Python 2)
7/3 → 2 returns “int”	7/3 → 2.333... returns “float”
range() returns list (memory intensive)	range() returns iterator (memory efficient; xrange in Python 2)

Python.org

The screenshot shows the Python.org homepage with several red arrows highlighting different features:

- A red arrow points from the top right towards the search bar and the "Documentation" button.
- A red arrow points from the middle right towards the "Download Python and IDLE" button.
- A red arrow points from the bottom left towards the "Get Started" section.

Top Navigation Bar:

- Python
- PSF
- Docs
- PyPI
- Jobs
- Community

Header Area:

- python™ logo
- Donate button
- Search bar with placeholder "+700,000 Python packages"
- GO button
- Socialize link

Main Navigation Bar:

- About
- Downloads
- Documentation
- Community
- Success Stories
- News
- Events

Content Sections:

- Documentation:** A code snippet demonstrating a for loop:

```
# For loop on a list
>>> numbers = [2, 4, 6, 8]
>>> product = 1
>>> for number in numbers:
...     product = product * number
...
>>> print('The product is:', product)
The product is: 384
```
- All the Flow You'd Expect:** Text about control flow statements.
- Download Python and IDLE:** A yellow button.
- Footer Call-to-Action:** Text: "Python is a programming language that lets you work quickly and integrate systems more effectively. [» Learn More](#)"
- Footer Links:**
 - Get Started:** Text: "Whether you're new to programming or an experienced developer, it's easy to learn and use Python." Link: "Start with our Beginner's Guide".
 - Download:** Text: "Python source code and installers are available for download for all versions!" Link: "Latest: Python 3.11.1".
 - Docs:** Text: "Documentation for Python's standard library, along with tutorials and guides, are available online." Link: "docs.python.org".
 - Jobs:** Text: "Looking for work or have a Python related position that you're trying to hire for? Our **relaunched community-run job board** is the place to go." Link: "jobs.python.org".

Installing Python

The image shows the Python website's download page and a Windows setup window side-by-side.

Python Website (Left):

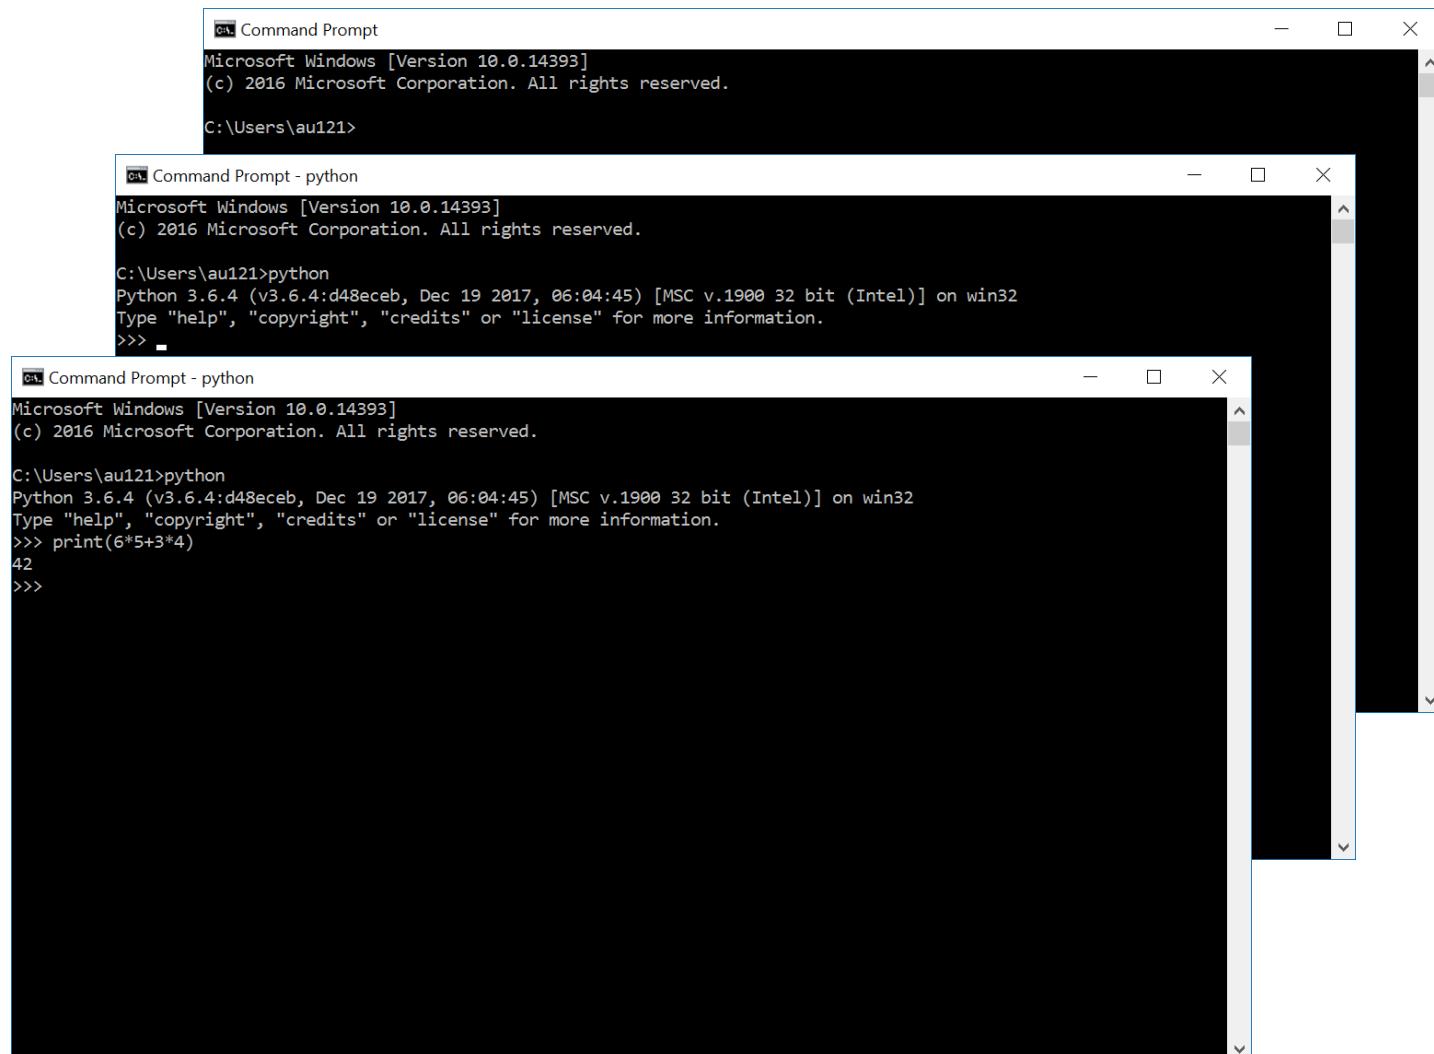

- The top navigation bar includes links for Python, PSF, Docs, PyPI, Jobs, and Community.
- The main header features the Python logo and the word "python".
- The "Downloads" menu item is highlighted with a red circle labeled 1.
- The "Download for Windows" section is shown, with the "Python 3.11.1" button highlighted with a red circle labeled 2.
- A note states: "Note that Python 3.9+ cannot be used on Windows 7 or earlier."
- Other download options listed include All releases, Source code, Windows, macOS, Other Platforms, License, and Alternative Implementations.

Windows Installer (Right):

- The title bar says "Python 3.11.1 (64-bit) Setup".
- The main window title is "Install Python 3.11.1 (64-bit)".
- Text: "Select Install Now to install Python with default settings, or choose Customize to enable or disable features."
- Install Now:** C:\Users\au121\AppData\Local\Programs\Python\Python311 (highlighted with a red circle labeled 4).
- Includes IDLE, pip and documentation.
- Creates shortcuts and file associations.
- Customize installation:** Choose location and features.
- Checkboxes:
 - Use admin privileges when installing py.exe (highlighted with a red circle labeled 3).
 - Add python.exe to PATH (highlighted with a red circle labeled 3).
- Buttons: "Cancel" and "IMPORTANT" (a large red arrow points to this button).

Running the Python Interpreter from a terminal

- Open Command Prompt
(Windows-key + cmd)
- Type “python” + return
- Start executing
Python statements
- To exit shell:
Ctrl-Z + return or
`exit()` + return
- Note: Sometimes “python”
is installed as “python3”

The image shows three stacked windows of a Microsoft Windows Command Prompt. Each window has a title bar labeled "Command Prompt". The top window shows the standard Windows command prompt environment. The middle window shows the Python interpreter running, with the Python version (3.6.4) and build information displayed. The bottom window shows a Python script being run, with the command `print(6*5+3*4)` and its output (42) displayed.

```
Microsoft Windows [Version 10.0.14393]

C:\Users\au121>python
Python 3.6.4 (v3.6.4:d48eceb, Dec 19 2017, 06:04:45) [MSC v.1900 32 bit (Intel)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> print(6*5+3*4)
42
>>>
```

Installing IPython – A more powerful interactive Python shell

- Open Command Prompt
 - Execute:

```
pip install ipython
```
 - Start IPython

```
ipython
```
-
- pip = the Python package manager
 - Note: Sometimes “pip” is installed as “pip3”

The image shows a Windows desktop with two windows open. The left window is a Command Prompt titled 'Command Prompt' with the title bar 'ca: Command Prompt'. It displays the Windows version information: 'Microsoft Windows [Version 10.0.14393]' and '(c) 2016 Microsoft Corporation. All rights reserved.' followed by the command 'C:\Users\au121>pip install ipython'. The right window is titled 'IPython: C:\Users\au121' with the title bar 'ca: IPython: C:\Users\au121'. It also displays the Windows version information and then shows the Python interpreter starting up: 'Python 3.6.4 (v3.6.4:d48eceb, Dec 19 2017, 06:04:45) [MSC v.1900 32 bit (Intel)]', 'Type "copyright", "credits" or "license" for more information', 'IPython 6.2.1 -- An enhanced Interactive Python. Type "?" for help.', and 'In [1]: -'.

Some other usefull packages

- Try installing some more Python packages:

pip install numpy

linear algebra support (N-dimensional arrays)

pip install scipy

numerical integration and optimization

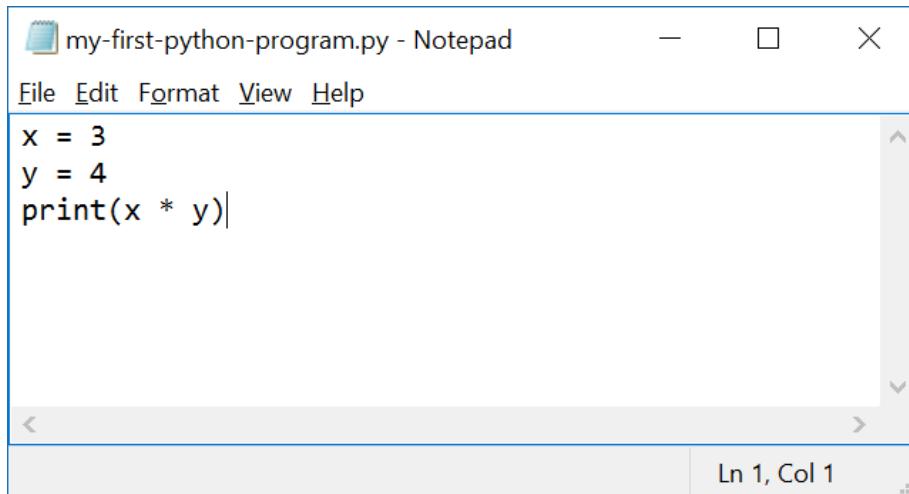

pip install matplotlib

2D and 3D plotting library

pip install pylint

Python source code analyzer enforcing a coding standard

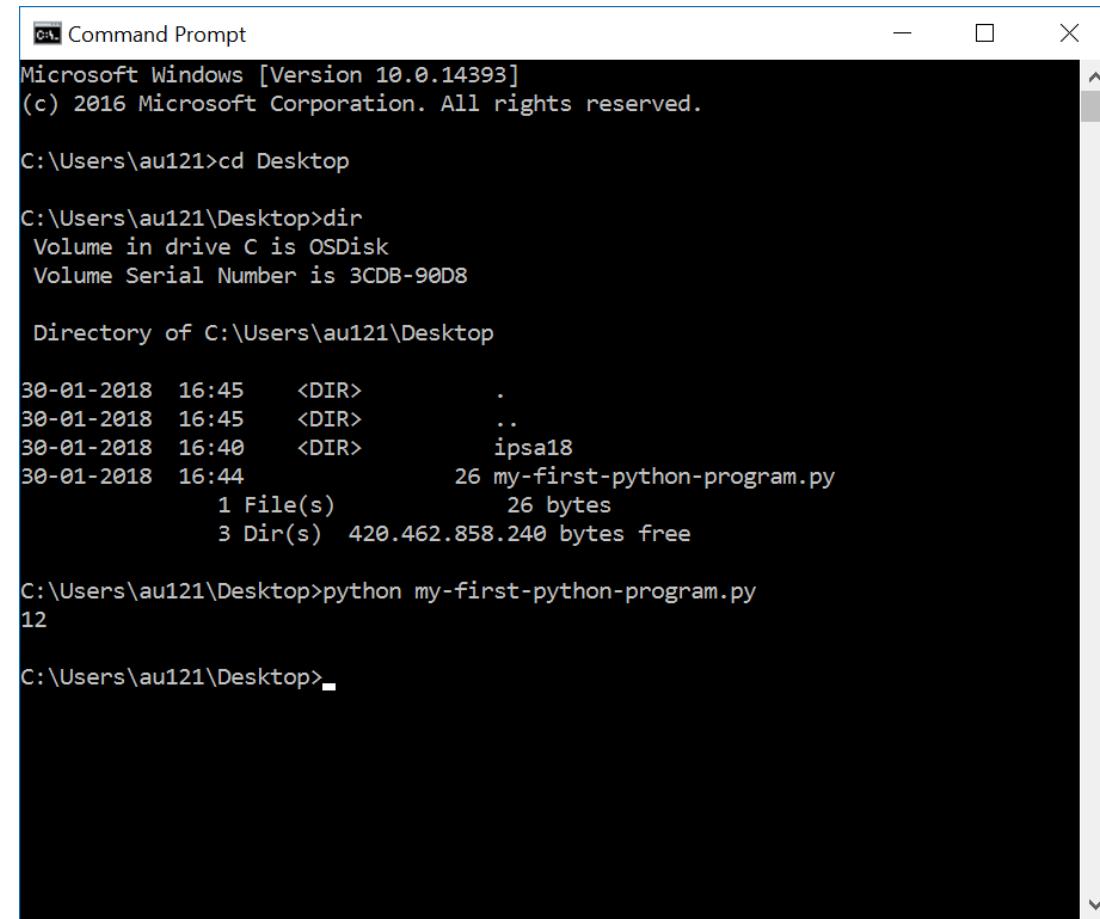

Creating a Python program the very basic way

A screenshot of a Windows Notepad window titled "my-first-python-program.py - Notepad". The window contains the following Python code:

```
x = 3
y = 4
print(x * y)
```

The status bar at the bottom right shows "Ln 1, Col 1".

A screenshot of a Windows Command Prompt window titled "Command Prompt". The window shows the following terminal session:

```
Microsoft Windows [Version 10.0.14393]
(c) 2016 Microsoft Corporation. All rights reserved.

C:\Users\au121>cd Desktop

- IDLE ships with Python from python.org
- Good beginner IDE (Integrated Development Environment)

The Python Ecosystem

- **Interpreters/compiler**
 - CPython – reference C implementation from python.org
 - PyPy – written in RPython (a subset of Python) – faster than CPython
 - Jython – written in Java and compiles to Java bytecode, runs on the JVM
 - IronPython – written in C#, compiles to Microsoft's Common Language Runtime (CLR) bytecode
 - Cython – project translating Python-ish code to C
- **Shells (IPython, IDLE, Jupyter)**
- **Libraries/modules/packages**
 - pypi.python.org/pypi (PyPI - the Python Package Index, +700.000 packages)
- **IDEs (Integrated development environment)**
 - IDLE comes with Python (docs.python.org/3/library/idle.html)
 - Anaconda w. Spyder, IPython (www.anaconda.com/download)
 - Canopy (enthought.com/product/canopy)
 - Visual Studio Code (code.visualstudio.com)
 - Python tools for Visual Studio (github.com/Microsoft/PTVS)
 - PyCharm (www.jetbrains.com/pycharm/)
 - Emacs (Python mode and ElPy mode)
 - Notepad++

Good beginner Python IDE

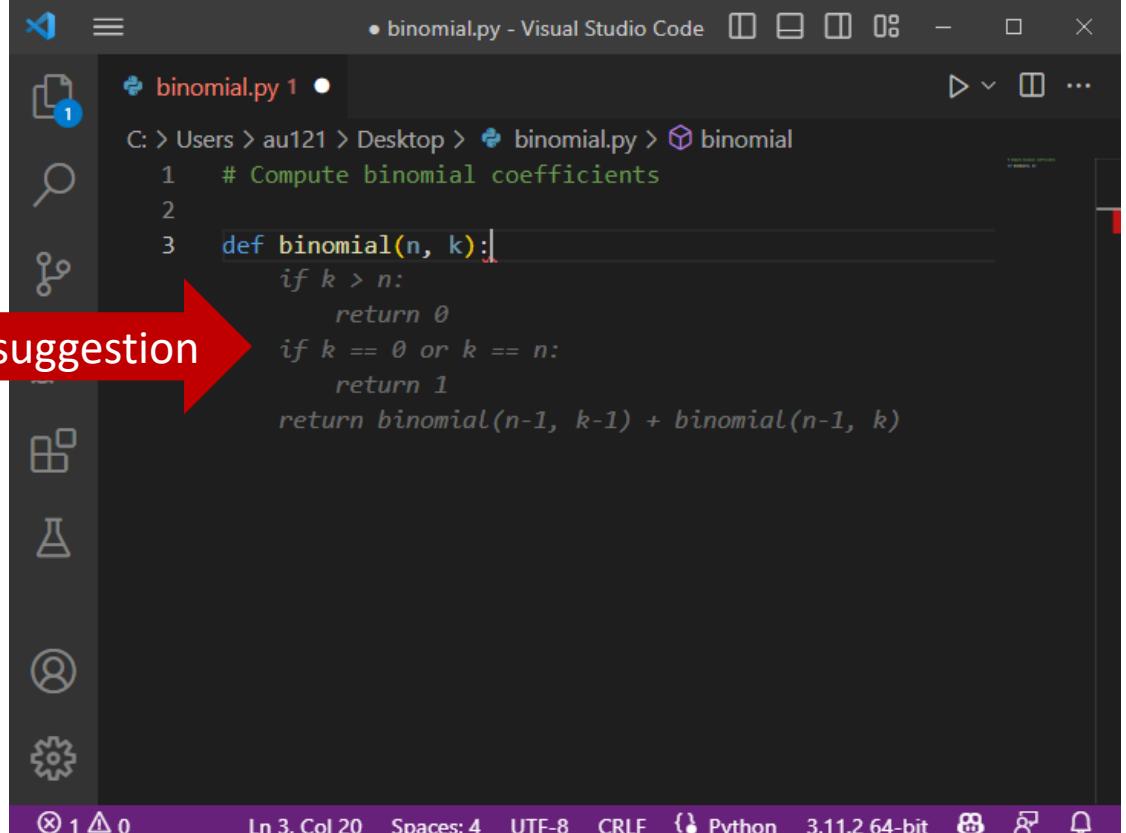

Visual Studio Code is used by more than twice as many developers than its nearest alternative, [Stack overflow survey 2025](#)
- **Python Style guide (PEP8)**
 - pylint, pep8, flake8
- **Python online**
 - Google colab (colab.research.google.com), repl.it, sagemath.org, ...
- **Pair programming plugins (share your editor with others)**
 - PyCharm : [Code With Me](#)
 - Visual Studio Code : [Live Share](#)

Try to google "[best ide python](#)"

IDEs and AI assistants

- Some IDEs integrate AI assistants to support code suggestions, e.g. [GitHub Copilot](#) in [VS Code](#)
- AI assistants increase productivity if you understand their output
- Interacting with an AI assistant can be a great programming tutor
-  AI assistants are not allowed at the exam

A screenshot of the Visual Studio Code interface. The title bar shows "binomial.py - Visual Studio Code". The left sidebar has a file icon with a blue dot (1) and a search icon. The main editor area contains Python code for calculating binomial coefficients:

```
C: > Users > au121 > Desktop > binomial.py > binomial
1 # Compute binomial coefficients
2
3 def binomial(n, k):
    if k > n:
        return 0
    if k == 0 or k == n:
        return 1
    return binomial(n-1, k-1) + binomial(n-1, k)
```

A red arrow points from the word "suggestion" to the code completion placeholder "def binomial(n, k):". The status bar at the bottom shows "Ln 3, Col 20" and "Python 3.11.2 64-bit".

Guido van Rossum, inventor of Python, on GitHub Copilot
"I use it every day. It writes a lot of code for me... and usually it is slightly wrong but it still saves me typing."
[Python and the Future of Programming](#), Guido van Rossum interviewed by Lex Fridman

PROGRAMMER'S PROBLEM
