### Selection sort

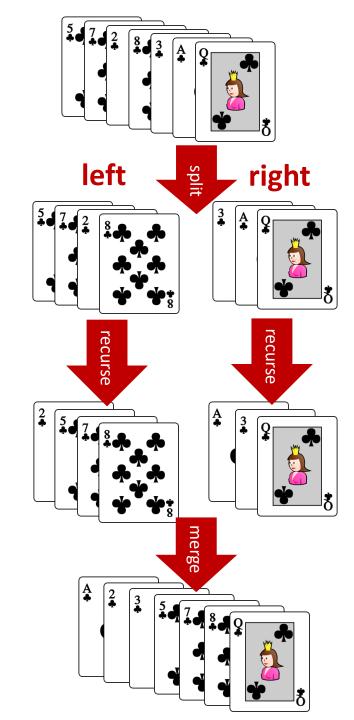

```
selection_sort.py
def selection sort(L):
    unsorted = L[:]
    result = []
    while unsorted:
        e = min(unsorted)
        unsorted.remove(e)
        result.append(e)
    return result
```

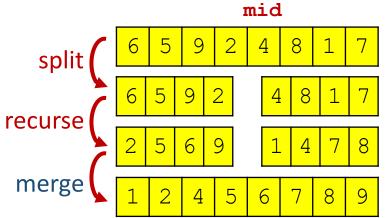

- min and .remove scan the remaining unsorted list for each element moved to result
- order |L|<sup>2</sup> comparisons

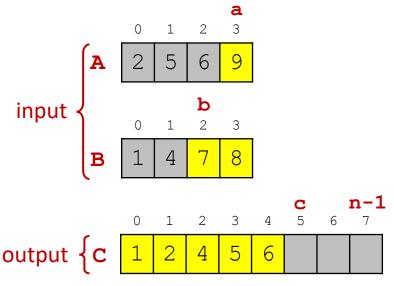

# Sorting a pile of cards (Merge sort)

- If one card in pile, i.e. pile is sorted
- Otherwise
  - 1) Split pile into two piles, **left** and **right**, of approximately same size
  - 2) Sort left and right recursively (independently)
  - 3) Merge left and right (which are sorted)

```
merge sort.py
def merge_sort(L):
    n = len(L)
    if n \le 1:
        return L[:]
    mid = n // 2
    left, right = L[:mid], L[mid:]
    return merge (merge sort(left), merge sort(right))
def merge(A, B):
    n = len(A) + len(B)
    C = n * [None]
    a, b = 0, 0
    for c in range(n):
        if a < len(A) and (b == len(B) \text{ or } A[a] < B[b]):
            C[c] = A[a]
            a = a + 1
        else:
            C[c] = B[b]
            b = b + 1
    return C
```

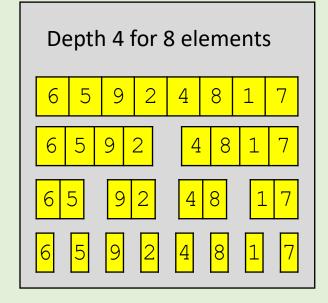

## Question – Depth of recursion for 52 elements

- a) 1
- b) 2
- c) 3
- d) 4
- e) 5
- f) 6
- 😶 g) 7
  - h) 8
  - i) 9
  - j) 10
  - k) Don't know

Max recursive subproblem size  $52 \rightarrow 26 \rightarrow 13 \rightarrow 7 \rightarrow 4 \rightarrow 2 \rightarrow 1$ 

# Question – Order of comparisons by Merge sort?

```
    a) ~ n
    b) ~ n√n
    c) ~ n log<sub>2</sub> n
    d) ~ n<sup>2</sup>
    e) ~ n<sup>3</sup>
    f) Don't know
```

```
merge sort.py
def merge sort(L):
    n = len(L)
    if n <= 1:
        return L[:]
    else:
        mid = n // 2
        left, right = L[:mid], L[mid:]
        return merge (merge sort(left), merge sort(right))
def merge(A, B):
    n = len(A) + len(B)
    C = n * [None]
    a, b = 0, 0
    for c in range(n):
        if a < len(A) and (b == len(B) \text{ or } A[a] < B[b]):
            C[c] = A[a]
            a = a + 1
        else:
            C[c] = B[b]
            b = b + 1
    return C
```

## Merge sort without recursion

- Start with piles of size one
- Repeatedly merge two smallest piles

```
merge sort.py
def merge sort iterative(L):
                                         insert at front of
    Q = [[x] \text{ for } x \text{ in } L]
    while len(Q) > 1;
         Q.insert(0, merge(Q.pop(), Q.pop()))
    return Q[0]
                                              deques are a
                                       generalization of lists
from collections import deque
                                       with efficient updates
def merge sort deque(L):
                                              at both ends
    Q = deque([[x] for x in L])
    while len(Q) > 1:
         Q.appendleft(merge(Q.pop(), Q.pop()))
    return Q[0]
```

```
merge\_sort\_iterative([7,1,9,3,-2,5])
```

#### Values of Q in while-loop

```
[[7], [1], [9], [3], [-2], [5]]

[[-2, 5], [7], [1], [9], [3]]

[[3, 9], [-2, 5], [7], [1]]

[[1, 7], [3, 9], [-2, 5]]

[[-2, 3, 5, 9], [1, 7]]

[[-2, 1, 3, 5, 7, 9]]
```

**Note**: Lists in Q appear in non-increasing length order, where longest  $\leq 2 \cdot$  shortest

## Question – Number of iterations of while-loop?

```
merge_sort_iterative([7, 1, 9, 3, -2, 5])
```

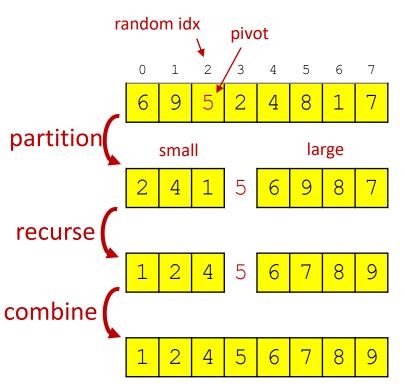

- a) 1
- b) 2
- c) 3
- d) 4
- 🙂 e) 5
  - f) 6
  - g) 7
  - h) Don't know

```
merge_sort.py

def merge_sort_iterative(L):
    Q = [[x] for x in L]
    while len(Q) > 1:
        Q.insert(0, merge(Q.pop(), Q.pop()))
    return Q[0]
```

# Quicksort (randomized)

```
quicksort.py
import random
def quicksort(L):
    if len(L) <= 1:
        return L[:]
    idx = random.randint(0, len(L) - 1)
    pivot = L[idx]
    other = L[:idx] + L[idx + 1:]
    small = [e for e in other if e < pivot]</pre>
    large = [e for e in other if e >= pivot]
    return quicksort(small) + [pivot] + quicksort(large)
```

### **Greatest Common Divisor (GCD)**

#### **Notation**

 $x\uparrow y$  denotes y is divisible by x, e.g.  $3\uparrow 12$  i.e.  $y = a \cdot x$  for some integer a

#### **Definition**

 $gcd(m, n) = max \{x \mid x \uparrow m \text{ and } x \uparrow n \}$ 

#### **Fact**

if  $x\uparrow y$  and  $x\uparrow z$  then  $x\uparrow (y+z)$  and  $x\uparrow (y-z)$ 

#### **Observation**

(recursive definition)

$$\gcd(m, n) = \begin{cases} m & \text{if } m = n \\ \gcd(m, n - m) & \text{if } m < n \\ \gcd(m - n, n) & \text{if } m > n \end{cases}$$

gcd(90, 24)

m	n
90	24
66	24
42	24
18	24
18	6
12	6
6	6

## **Greatest Common Divisor (GCD)**

```
gcd.py

def gcd(m, n):
    while n != 0:
        m, n = n, m % n
    return m
```

```
gcd_slow_recursive.py

def gcd(m, n):
    if m == n:
        return m
    elif m > n:
        return gcd(m - n, n)
    else:
        return gcd(m, n - m)
```

```
gcd_recursive.py

def gcd(m, n):
    if n == 0:
        return m
    else:
        return gcd(n, m % n)
```

```
gcd_recursive_one_line.py

def gcd(m, n):
    return m if n == 0 else gcd(n, m % n)
```

### **Permutations**

Generate a list L of all permutations of a tuple

```
def permutations(L):
    if len(L) == 0:
        return [L[:]] # empty tuple (ensures same type as L)
    else:
        P = permutations(L[1:])
        return [p[:i] + L[:1] + p[i:] for p in P for i in range(len(L))]
```

An implementation of "permutations" exists in the "itertools" library

### Maze solver

### Input

- First line #rows and #columns
- Following #rows lines contain strings containing #column characters
- There are exactly one 'A' and one 'B'
- '.' are free cells and '#' are blocked cells

### Output

 Print whether there is a path from 'A' to 'B' or not

#### maze input

```
