#### Multi-dimensional data

- NumPy
- matrix multiplication, @
- numpy.linalg.solve, numpy.polyfit

Array programming with NumPy
Harris et al.
Nature, volume 585, pages 357–362, 2020
DOI 10.1038/s41586-020-2649-2

NumPy is a Python package for dealing with multi-dimensional data

## pylab?

Guttag [2<sup>nd</sup> edition] uses pylab in the examples, but...

"pylab is a convenience module that bulk imports matplotlib.pyplot (for plotting) and numpy (for mathematics and working with arrays) in a single name space. Although many examples use pylab, it is no longer recommended."

# NumPy arrays (example)

```
Python shell
> range(0, 1, .3)
| TypeError: 'float' object cannot be
  interpreted as an integer
> [1 + i / 4 for i in range(5)]
| [1.0, 1.25, 1.5, 1.75, 2.0]
```

python only supports ranges of int generate 5 uniform values in range [1,2]

#### Python shell

```
> import numpy as np
> np.arange(0, 1, 0.3)
| array([0. , 0.3, 0.6, 0.9])
> type(np.arange(0, 1, 0.3))
| <class 'numpy.ndarray'>
> help(numpy.ndarray)
| +2000 lines of text
> np.linspace(1, 2, 5)
| array([1. , 1.25, 1.5 , 1.75, 2. ])
```

numpy can generate ranges with float

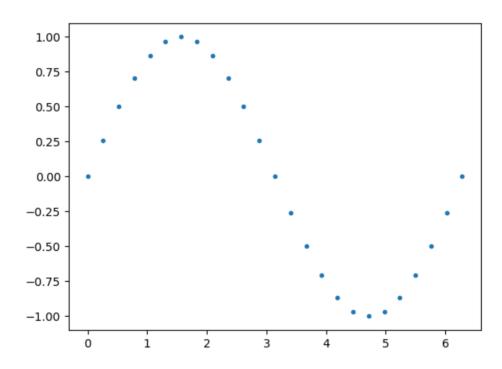

returns a "NumPy array" (not a list)
"arange" = "array range" and generates the array explicitly

generate n uniformly spaced values

# Plotting a function (example)

```
import matplotlib.pyplot as plt
import math
n = 25
x = [2 * math.pi * i / (n - 1) for i in range(n)]
y = [math.sin(v) for v in x]
plt.plot(x, y, '.')
plt.show()
```

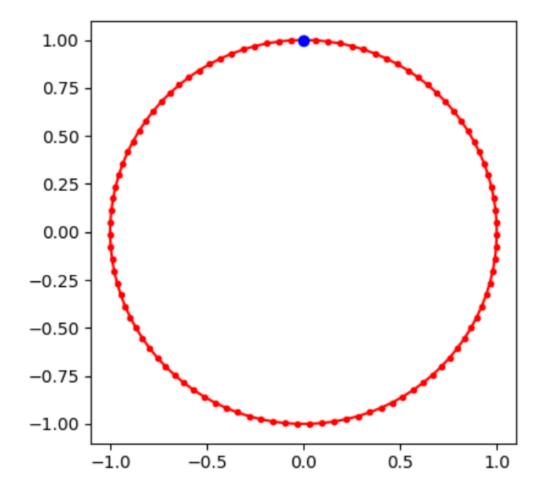

```
import matplotlib.pyplot as plt
import numpy as np
x = np.linspace(0, 2 * np.pi, 25)
y = np.sin(x)
plt.plot(x, y, '.')
plt.show()
```

- np.sin applies the sin function to each element of x
- pyplot accepts NumPy arrays
- math.pi == np.pi  $\approx \frac{22}{7}$

#### A circle

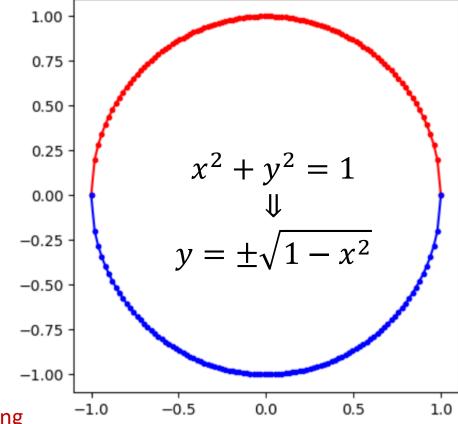

```
circle.py
import matplotlib.pyplot as plt
import numpy as np
a = np.linspace(0, 2 * np.pi, 100)
x = np.sin(a)
y = np.cos(a)
plt.plot(x, y, 'r.-')
plt.plot(x[0], y[0], 'bo')
plt.show()
```

#### Two half circles

```
half_circles.py
import matplotlib.pyplot as plt
import numpy as np

x = np.linspace(-1, 1, 100)
plt.plot(x, np.sqrt(1 - x ** 2), 'r.-')
plt.plot(x, -np.sqrt(1 - x ** 2), 'b.-')
plt.show()
```

compact expression computing something quite comlicated

- x is a NumPy array
- \*\* NumPy method pow squaring each element in x
- binary NumPy method \_\_rsub\_\_ that for each element e in x computes 1 e
- np.sqrt NumPy method computing the square root of each element in  $\boldsymbol{x}$
- unary NumPy method neg that negates each element in x

#### Creating one-dimensional NumPy arrays

#### Python shell

```
> np.array([1, 2, 3])
 array([1, 2, 3])
> np.array((1, 2, 3))
 array([1, 2, 3])
> np.array(range(1, 4))
 array([1, 2, 3])
> np.arange(1., 4., 1.)
 array([1., 2., 3.])
> np.linspace(1, 3, 3)
 array([1., 2., 3.])
> np.zeros(3)
 array([0., 0., 0.])
> np.ones(3)
 array([1., 1., 1.])
> np.full(3, 7)
 array([7, 7, 7])
> np.random.random(3)
 array([0.73761651,
  0.60607355, 0.3614118 ])
```

```
> np.array([1, 2, 3]).dtype # type of all values
dtype('int32')
> np.arange(3, dtype='float')
array([0., 1., 2.])
> np.arange(3, dtype='int16') # 16 bit integers
array([0, 1, 2], dtype=int16)
> np.arange(3, dtype='int32') # 32 bit integers
array([0, 1, 2])
> 1000 ** np.arange(5)
 array([1, 1000, 1000000, 1000000000, -727379968],
  dtype=int32) # OOPS.. overflow
> 1000 ** np.arange(5, dtype='0')
  array([1, 1000, 1000000, 1000000000,
  10000000000], dtype=object) # Python integer
> np.arange(3, dtype='complex')
 array([0.+0.j, 1.+0.j, 2.+0.j])
     Elements of a NumPy array are not arbitrary precision integers by
  default – you can select between +25 number representations
```

## Mantissa size in various numpy floats

```
Python shell
> for data type in ['half', 'float', 'single', 'double', 'longdouble', 'float32', 'float64']:
    x = np.array([1], dtype=data_type)
    for i in range (100):
      if x == x + (x / 2) ** i: \leftarrow
                                                                     mantissa
        break
    print(data type, i - 1, 'bits mantissa')
                                                                 1.0000100000
  half 10 bits mantissa
  float 52 bits mantissa
  single 23 bits mantissa
  double 52 bits mantissa
  longdouble 52 bits mantissa
  float32 23 bits mantissa
                                      # platform independent
                                       # platform independent
  float64 52 bits mantissa
```

## Creating multi-dimensional NumPy arrays

```
Python shell
> np.array([[1, 2, 3], [4, 5, 6]])
                                      > x.size
 array([[1, 2, 3],
                                        12
         [4, 5, 6]])
                                      > x.ndim
> np.array([[1, 2], [4, 5, 6]])
 ValueError: inhomogeneous shape 🔼
                                      > x.shape
> np.arange(1, 7).reshape(2, 3)
                                      (2, 2, 3)
 array([[1, 2, 3],
                                      > x.dtvpe
         [4, 5, 6]])
                                      dtype('int32')
> x = np.arange(12).reshape(2, 2, 3)
                                      > x.flatten()
> x
                                       array([0,1,2,3,4,5,6,7,8,9,10,11])
  array([[[ 0, 1, 2],
                                      > list(x.flat) # flat is an iterator
         [ 3, 4, 5]],
                                      [0,1,2,3,4,5,6,7,8,9,10,11]
                                      > np.eye(3) # diagonal 2D array
         [[ 6, 7, 8],
                                        array([[1., 0., 0.],
          [ 9, 10, 11]])
                                               [0., 1., 0.],
                                               [0., 0., 1.]]
> numpy.zeros((2, 5), dtype='int32')
  array([[0, 0, 0, 0, 0],
         [0, 0, 0, 0, 0]
```

## View vs Copy

- Numpy is optimized to handle big multi-dimensional arrays
- To avoid copying data, views allows one to look at the underlying data in different ways (data can be shared by multiple views)
- reshape, ravel and slicing are examples creating views
- flatten and ravel both turn multiple dimensional arrays into one dimensional arrays but flatten creates an explicit copy whereas ravel creates a space efficient view

#### Python shell

```
> x = np.arange(6)
> y = x.reshape(2, 3) # view
> y[0][0] = 42 # updates x
> x
array([42, 1, 2, 3, 4, 5])
> y
| array([[42, 1, 2],
        [ 3, 4, 5]])
> z = y.flatten() # copy
> z[5] = 0
array([42, 1, 2, 3, 4, 0])
> x
array([42, 1, 2, 3, 4, <mark>5</mark>])
> w = y.ravel() # view
> w[5] = -1
 array([42, 1, 2, 3, 4, -1])
> x
 array([42, 1, 2, 3, 4, -1])
```

# NumPy operations

```
Python shell
> x = numpy.arange(3)
                                                  > a = np.arange(6).reshape(2,3)
> x
                                                  > a
| array([0, 1, 2])
                                                   array([[0, 1, 2],
> x + x # elementwise addition
                                                           [3, 4, 5]])
                                                  > a.T # matrix transposition, view
array([0, 2, 4])
> 1 + x # add integer to each element
                                                   array([[0, 3],
| array([1, 2, 3])
                                                           [1, 4],
> x * x # elementwise multiplication
                                                           [2, 5]])
                                                  > a @ a.T # matrix multiplication
| array([0, 1, 4])
> np.dot(x, x) # dot product
                                                   array([[ 5, 14],
                                                           [14, 50]])
> np.cross([1, 2, 3], [3, 2, 1]) # cross product
                                                  > a += 1
 array([-4, 8, -4])
                                                   array([[1, 2, 3],
                                                           [4, 5, 6]])
```

# Universal functions (apply to each entry)

#### **Axis**

```
Python shell
> x = np.arange(1, 7).reshape(2, 3)
> x
 array([[1, 2, 3],
         [4, 5, 6]])
> x.sum() # = x.sum(axis=(0, 1))
 21
> x.sum(axis=0)
 array([5, 7, 9])
> x.sum(axis=1)
 array([6, 15])
> x.min() # = x.min(axis=(0, 1))
 1
```

```
Python shell
> x.min(axis=0)
 array([1, 2, 3])
> x.min(axis=1)
 array([1, 4])
> x.cumsum()
 array([ 1, 3, 6, 10, 15, 21], dtype=int32)
> x.cumsum(axis=0)
 array([[1, 2, 3],
         [5, 7, 9]], dtype=int32)
> x.cumsum(axis=1)
 array([[ 1, 3, 6],
         [ 4, 9, 15]], dtype=int32)
```

## Slicing

#### Python shell > x = numpy.arange(20).reshape(4, 5)> x array([[ 0, 1, 2, 3, 4], [ 5, 6, <mark>7</mark>, **8**, 9], [10, 11, 12, 13, 14], [15, 16, **17**, **18**, 19]]) > x[2, 3] # = x[(2, 3)]13 > x[1:4:2, 2:4:1] # rows 1 and 3, and columns 2 and 3, view | array([[ 7, 8], [17, 18]]) > x[:, 3]array([ 3, 8, 13, 18]) > x[..., 3] # ... is placeholder for ':' for all missing dimensions | array([ 3, 8, 13, 18]) > type(...) <class 'ellipsis'>

# Broadcasting (stretching arrays to get same size)

Numpy tries to apply broadcasting, if array shapes do not match, i.e. adds missing leading dimensions and repeats a dimension with only one element:

```
[[1], [2]] + [10, 20] column + row vector

\equiv [[1], [2]] + [[10, 20]] both ndim = 2

\equiv [[1, 1], [2, 2]] + [[10, 20]]

\equiv [[1, 1], [2, 2]] + [[10, 20], [10, 20]]

\equiv [[11, 21], [12, 22]]
```

To prevent unexpected broadcasting, add an assertion to your program:

```
assert x.shape == y.shape
```

```
Python shell
> x = np.array([[1, 2, 3], [4, 5, 6]])
> y = np.array([1, 2, 3]) # one row
> z = np.array([[1], [2]]) # one column
> x + 3 \# add 3 to each entry
 array([[4, 5, 6],
   [7, 8, 9]])
> x + y # add y to each row
array([[2, 4, 6],
   [5, 7, 9]])
> x + z # add z to each column
 array([[2, 3, 4],
    [6, 7, 8]])
> y + z # 2 rows with y + 3 columns with z
 array([[2, 3, 4],
        [3, 4, 5]])
> z == z.T \# [[1,1],[2,2]] == [[1,2],[1,2]]
 array([[ True, False],
         [False, True]])
```

## Masking

```
Python shell
> x = np.arange(1, 11).reshape(2, 5)
> x
array([[ 1, 2, 3, 4, 5],
        [ 6, 7, 8, 9, 10]])
> x % 3
array([[1, 2, 0, 1, 2],
        [0, 1, 2, 0, 1]], dtype=int32)
> x % 3 == 0
 array([[False, False, True, False, False],
         [ True, False, False, True, False]])
> x[x % 3 == 0] # use Boolean matrix to select entries
array([3, 6, 9])
> x[:, x.sum(axis=0) % 3 == 0] # columns with sum divisible by 3
 array([[ 2, 5],
        [ 7, 10]])
```

### Numpy is fast... but be aware of dtype $\triangle$

#### Python shell > sum([x\*\*2 for x in range(1000000)]) 333332833333500000 > (np.arange(1000000)\*\*2).sum() 584144992 # wrong since overflow when default dtype='int32' > (np.arange(1000000, dtype='int64')\*\*2).sum() 33333283333500000 # 64 bit integers do not overflow > import timeit from timeit > timeit('sum([x\*\*2 for x in range(1000000)])', number=1) 0.5614346340007614 > timeit('(np.arange(1000000)\*\*2).sum()', setup='import numpy as np', number=1) 0.014362967000124627 # ridiculous fast but also wrong result... > timeit('(np.arange(1000000, dtype='int64')\*\*2).sum()', setup='import numpy as np', number=1) 0.048017077999247704 # fast and correct > np.iinfo(np.int32).min -2147483648 > np.iinfo(np.int32).max

2147483647

#### numpy.int32 – 32 bit signed two's-complement integers

32 bits  $b_{31}b_{30}b_{29}b_{28}\cdots b_2b_1b_0$  represent the value

$$-b_{31} \cdot 2^{31} + \sum_{i=0}^{30} b_i \cdot 2^i$$

## Animating bouncing balls

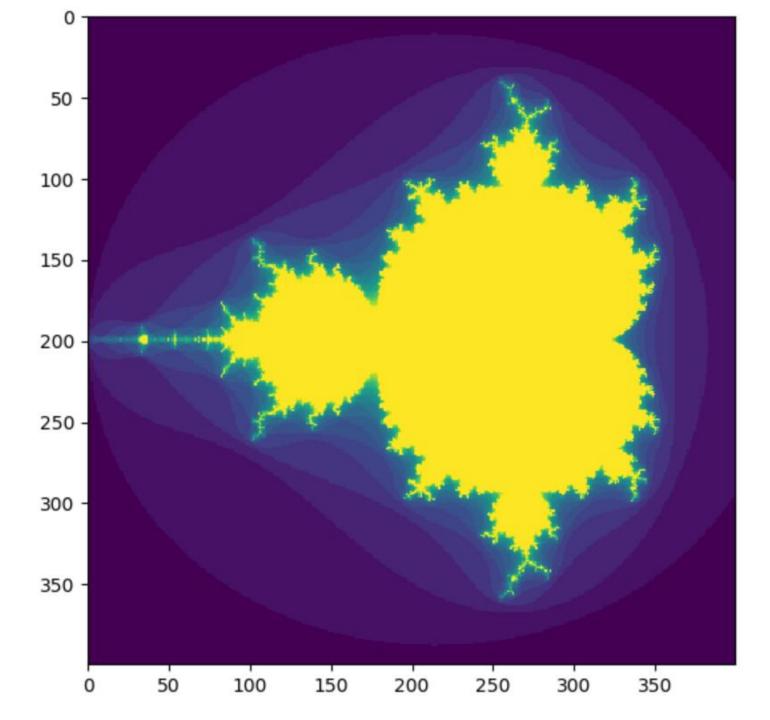

matplotlib figures can be animated using

```
matplotlib.animation.FuncAnimation
```

that as arguments takes the figure to be updated/ redrawn, a function to call for each update, and an interval in milliseconds between updates

```
balls.py
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation
from numpy import zeros, maximum, minimum
from numpy.random import random
q = 0.01
N = 10
x, y = 10.0 * random(N), 1.0 + 9.0 * random(N)
dx, dy = random(N) / 5, zeros(N)
fig = plt.figure()
plt.xlim(0, 10)
plt.ylim(0, 10)
balls, = plt.plot(x, y, 'o') # returns Line2D obj
def move(frame):
    global x, y, dx, dy
    x += dx
    bounce = (x > 10.0) | (x < 0.0) # numpy mask
    dx[bounce] = -dx[bounce]
    x = minimum(10.0, maximum(0.0, x))
    y += dy
    bounce = y < 0.0 \# numpy mask
    y[bounce] -= dy[bounce]
    dy[bounce] = -dy[bounce]
    dy -= q
    balls.set data(x, y) # update positions
# removing 'ani =' causes program to fail...
