Dictionaries and Sets

- dict
- set
- frozenset
- set/dict comprehensions

Dictionaries (type dict)

$$\{\ key_1\colon\ value_1,\ \ldots,\ key_k\colon\ value_k\ \}$$

- Stores a mutable set of (key, value) pairs, denoted *items*, with distinct keys, i.e. *maps* keys to values

- Constructing empty dictionary: `dict()` or `{}`

- *dict*[*key*] lookup for key in dictionary, and returns associated value. Key must be present, otherwise a KeyError is raised

- *dict*[*key*] = *value* assigns value to *key*, overriding exising value if present

key	value
'a'	7
'foo'	'42nd'
5	29
'5'	44
5.5	False
False	True
(3, 4)	'abc'

↑

distinct keys,
i.e. not "=="

https://docs.python.org/3/tutorial/datastructures.html#dictionaries

Dictionaries (type dict)

Python shell

```
> d = {'a': 42, 'b': 57}
> d
| {'a': 42, 'b': 57}

> d.keys()
| dict_keys(['a', 'b'])

> list(d.keys())
| ['a', 'b']

> d.items()
| dict_items([('a', 42), ('b', 57)])

> list(d.items())
| [('a', 42), ('b', 57)]
```

```
> for key in d:
        print(key)
| a
| b

> for key, val in d.items():
        print('Key', key, 'has value', val)
| Key a has value 42
| Key b has value 57

> {5: 'a', 5.0: 'b'}       ⚠
| {5: 'b'}
```

Python shell

```
> surname = dict(zip(['Donald', 'Mickey', 'Scrooge'], ['Duck', 'Mouse', 'McDuck']))
> surname['Mickey']
| 'Mouse'
```

Dictionaries (type dict)

```
Python shell
> gradings = [('A', 7), ('B', 4), ('A', 12), ('C', 10), ('A', 7)]
> grades = {}   # empty dictionary
> for student, grade in gradings:
      if student not in grades:   # is key in dictionary
          grades[student] = []
      grades[student].append(grade)
> grades
| {'A': [7, 12, 7], 'B': [4], 'C': [10]}
> print(grades['A'])
| [7, 12, 7]
> print(grades['E'])   # can only lookup keys in dictionary
| KeyError: 'E'
> print(grades.get('E'))   # .get returns None if key not in dictionary
| None
> print(grades.get('E', []))   # change default return value
| []
> print(grades.get('A', []))
| [7, 12, 7]
```

Dictionary initialization

```
Python shell

> d1 = {'A': 7, 'B': 42}
> d2 = dict([('A', 7), ('B', 42)])    # list of (key, value) pairs
> d3 = dict(A=7, B=42)                 # keyword arguments to constructor
> d1 == d2 == d3
| True
```

- **Note**: *keyword initialization* only works if keys are strings which are valid keyword arguments to a function – but saves writing a lot of quotes

⚠ | and |=

new in
Python 3.9
PEP 584

```
Python shell

> d1 = dict(A=1, B=2)
> d2 = dict(B=3, C=4)
> d1 | d2                                        # merge dictionaries
| {'A': 1, 'B': 3, 'C': 4}                       # rightmost value for 'B' wins
> {**d1, **d2, 'D': 5}                           # ** inserts dictionary content
| {'A': 1, 'B': 3, 'C': 4, 'D': 5}               # rightmost value for 'B' wins
> d1 |= d2                                       # same as d1.update(d2)
> d1
| {'A': 1, 'B': 3, 'C': 4}
```

Dictionary operation	Description
len(d)	Items in dictionary
d[key]	Lookup key
d[key] = value	Update value of key
del d[key]	Delete an existing key
key in d	Key membership
key not in d	Key non-membership
clear()	Remove all items
copy()	Shallow copy
get(key), get(key, default)	d[key] if key in dictionary, otherwise `None` or default
items()	*View* of the dictionaries items
keys()	*View* of the dictionaries keys
values()	*View* of the dictionaries values
pop(key)	Remove key and return previous value
popitem()	Remove and return an arbitrary item
update()	Update key/value pairs from another dictionary

https://docs.python.org/3/library/stdtypes.html#mapping-types-dict

Tuples as dictionary keys

- A tuple can be used as a dictionary key, and parenthesis can be omitted

```
Python shell -
> d = {('a', 1): 7, ('b', 2): 42}
> d[('b', 2)]
| 42
> d['b', 2]    # same as above, parenthesis omitted
| 42
> T = [[None, None], [42, None]]   # 2D table as lists-of-lists
> T[1][0]
| 42
> T[1, 0]   # wrong, T is a list (of lists)
| TypeError: list indices must be integers or slices, not tuple
> T = {(1, 0): 42}   # 2D table as dictionary
> T[1, 0]   # dictionary lookup with tuple (1, 0) as key
| 42
> T[1][0]   # wrong, T has only one key = the tuple (1, 0)
| KeyError: 1
```

Order returned by `list(d.keys())` ?

The Python Standard Library
Mapping Types — dict

"Dictionaries preserve insertion order. Note that updating a key does not affect the order. Keys added after deletion are inserted at the end." (since Python 3.7)

docs.python.org/3/library/stdtypes.html

Python shell

```
> d = {'d': 1, 'c': 2, 'b': 3, 'a': 4}
> d['x'] = 5     # new key at end
> d['c'] = 6     # overwrite value
> del d['b']     # remove key 'b'
> d['b'] = 7     # reinsert key 'b' at end
> d
| {'d': 1, 'c': 6, 'a': 4, 'x': 5, 'b': 7}
```

Modern Python Dictionaries
A confluence of a dozen great ideas

Dictionary comprehension

- Similarly to creating a list using list comprehension, one can create a set of key-value pairs:

$$\{key : value \ \text{for} \ variable \ \text{in} \ list\}$$

```
Python shell
> names = ['Mickey', 'Donald', 'Scrooge']
> list(enumerate(names, start=1))
| [(1, 'Mickey'), (2, 'Donald'), (3, 'Scrooge')]
> dict(enumerate(names, start=1))
| {1: 'Mickey', 2: 'Donald', 3: 'Scrooge'}
> {name: idx for idx, name in enumerate(names, start=1)}
| {'Mickey': 1, 'Donald': 2, 'Scrooge': 3}
```

Sets (set and frozenset)

$$\{ value_1, \ldots, value_k \}$$

- Values of type `set` represent mutable sets, where "==" elements only appear once

- Do **not** support: indexing, slicing

- `frozenset` is an immutable version of `set`

Operation	Description
S | T	Set union
S & T	Set intersection
S − T	Set difference
S ^ T	Symmetric difference
set()	Empty set ({} = empty dictionary ⚠️)
set(L)	Create set from sequence
x in S	Membership
x not in S	Non-membership
S.isdisjoint(T)	Disjoint sets
S <= T	Subset
S < T	Proper subset
S >= T	Superset
S > T	Proper superset
len(S)	Size of S
S.add(x)	Add x to S (not frozenset)

Python shell

```
> S = {2, 5, 'a', 'c'}        > S ^ T
> T = {3, 4, 5, 'c'}          | {2, 3, 4, 'a'}
> S | T                       > S - T
| {2, 3, 4, 5, 'a', 'c'}      | {2, 'a'}
> S & T                       > {4, 5, 5.0, 5.1}
| {5, 'c'}                    | {4, 5, 5.1}   ⚠️
```

https://docs.python.org/3/tutorial/datastructures.html#sets
https://docs.python.org/3/library/stdtypes.html#set-types-set-frozenset

Question – What value has the expression ?

```
sorted( { 5, 5.5, 5.0, '5' } )
```

a) {'5', 5, 5.0, 5.5}

b) {5, 5.5}

c) ['5', 5.0, 5.5]

d) ['5', 5, 5.5]

e) TypeError

f) Don't know

Sets of (frozen) sets

- Sets are mutable, i.e. cannot be used as dictionary keys or elements in sets
- Frozen sets can

```
Python shell
> S = {{'a'}, {'a', 'b'}, {'a', 'c'}}
| TypeError: unhashable type: 'set'
> S = {frozenset({'a'}), frozenset({'a', 'b'}), frozenset({'a', 'c'})}
> frozenset({'a', 'b'}) in S
| True
> {'a', 'b'} in S   # automatically converts unhashable set to frozenset
| True
> {'a', 'b'} == frozenset(['a', 'b'])   # frozenset from list
| True
> D = {frozenset({'a', 'b'}): 42}   # dictionary
> frozenset({'a', 'b'}) in D
| True
> {'a', 'b'} in D   # dictionaries are not that friendly as sets
| TypeError: unhashable type: 'set'
```

Set comprehension

- Similarly to creating a list using list comprehension, one can create a set of values (also using nested for- and if-statements):

$$\{ value \; \texttt{for} \; variable \; \texttt{in} \; list \}$$

- A value occurring multiple times as *value* will only be included once

primes_set.py

```python
n = 101
not_primes = {m for f in range(2, n) for m in range(2 * f, n, f)}
primes = set(range(2, n)) - not_primes
```

Python shell

```
> L = ['a', 'b', 'c']
> {(x,(y,z)) for x in L for y in L for z in L if x != y and y != z and z != x}
| {('a',('b','c')),('a',('c','b')),('b',('a','c')),...,('c',('b','a'))}
> L = {'a', 'b', 'c'}
> {(x,(y,z)) for x in L for y in L - {x} for z in L - {x, y}}
| {('c',('b','a')),('c',('a','b')),('a',('c','b')),...,('b',('a','c'))}
```
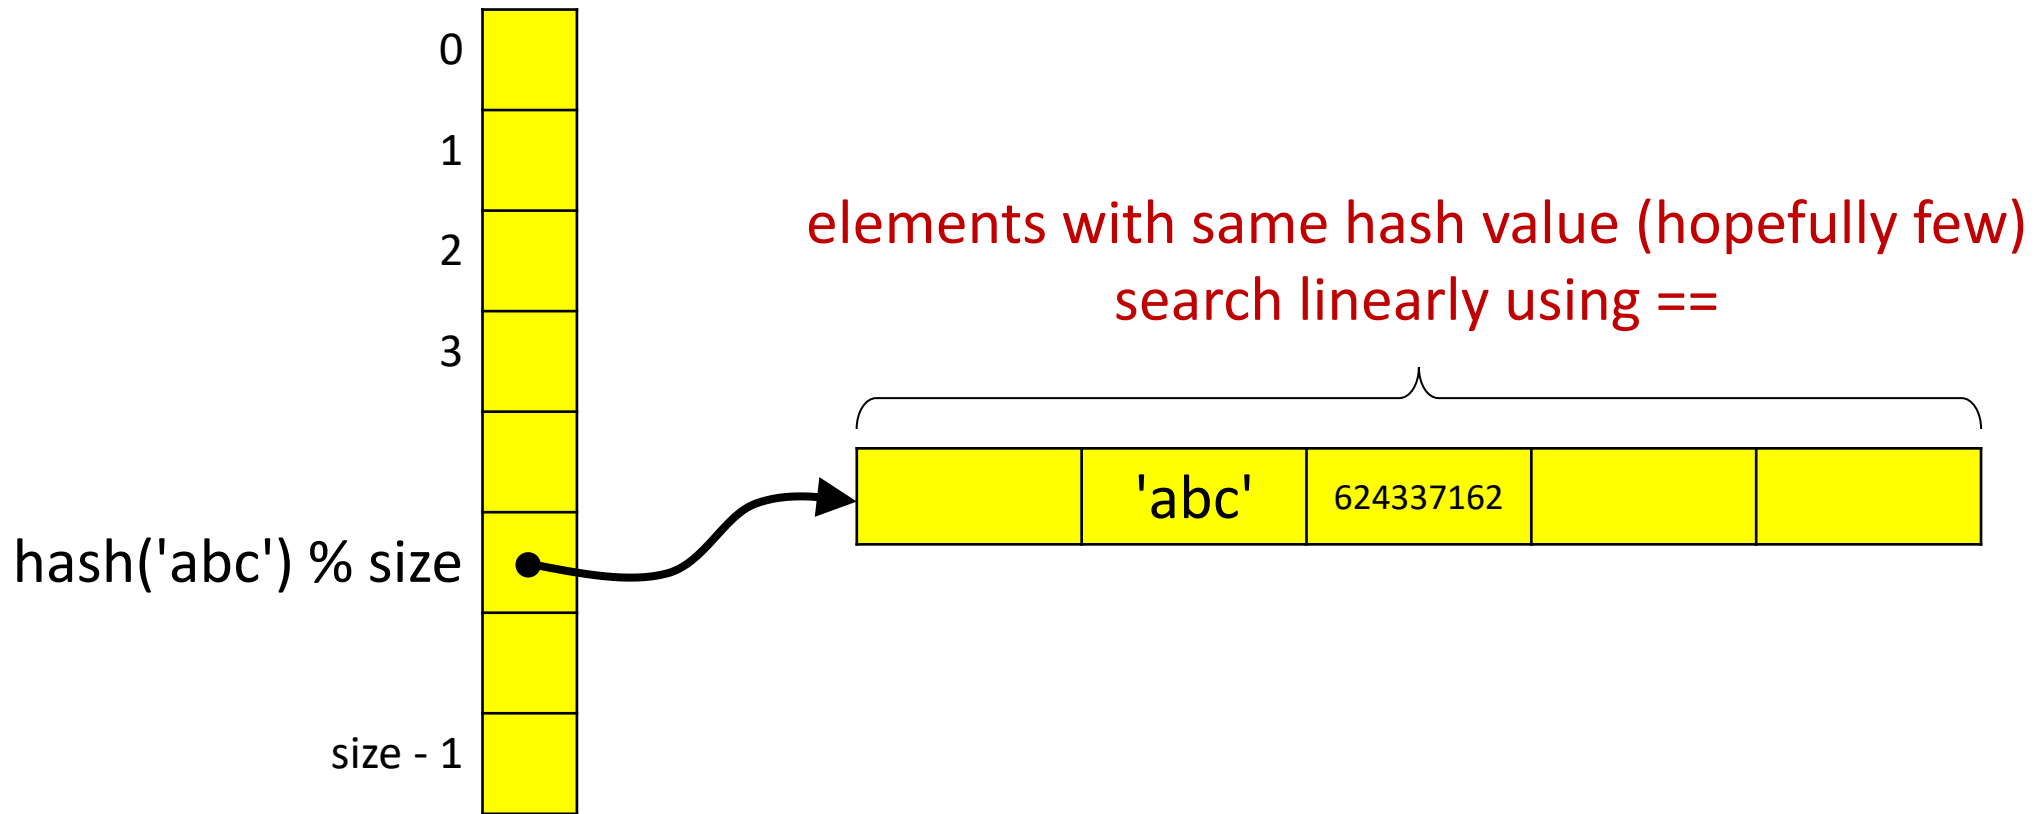

Hash, equality, and immutability

- Keys for dictionaries and sets must be *hashable*, i.e. have a __hash__() method returning an integer that does not change over their lifetime and an __eq__() method to check for equality with "=="

```
      'abc'.__hash__()  could e.g. return 624337162
  (624337162).__hash__()  would also return 624337162
```

- All built-in immutable types are hashable. In particular tuples of immutable values are hashable. I.e. trees represented by nested tuples like ((('a'),'b'),('c',('d','e'))) can be used as dictionary keys or stored in a set

Sketch of internal set implementation

elements with same hash value (hopefully few)
search linearly using ==

0
1
2
3

hash('abc') % size

size - 1

'abc'   624337162

Module `collections` (container datatypes)

- Python builtin containers for data: `list`, `tuple`, `dict`, and `set`.

- The module **`collections`** provides further alternatives
(but these are not part of the language like the builtin containers)

`deque`	double ended queue
`namedtuple`	tuples allowing access to fields by name
`Counter`	special dictionary to count occurrences of elements
...	

https://docs.python.org/3/library/collections.html

deque – <u>d</u>ouble <u>e</u>nded <u>queues</u>

- Extends lists with efficient updates at the front

- ⚠ Inserting at the front of a standard Python list takes linear time in the size of the list – very slow for long lists

Python shell

```
> L = list()
> L.append(1)
> L.append(2)
> L.insert(0, 0)   # insert at the front
> L.insert(0, -1)  # slow for long lists
> L.insert(0, -2)
> L
| [-2, -1, 0, 1, 2]
```

```
> from collections import deque
> d = deque()   # create empty deque
> d.append(1)
> d.append(2)
> d.appendleft(0)   # efficient
> d.appendleft(-1)
> d.appendleft(-2)
> d
| deque([2, 1, 0, -1, -2])
> for e in d: print(e, end=', ')
| -2, -1, 0, 1, 2,
```

namedtuple – tuples with field names

- Compromise between `tuple` and `dict`, can increase code readability

```
Python shell
> person = ('Donald Duck', 1934, '3 feet')  # as tuple
> person[1]  # not clear what is accessed
| 1934
> person = {'name': 'Donald Duck', 'appeared': 1934, 'height': '3 feet'}  # as dict
> person['appeared']  # more clear what is accessed, but ['...'] overhead
| 1934

> from collections import namedtuple
> Person = namedtuple('Person', ['name', 'appeared', 'height'])  # create new type
> person = Person('Donald Duck', 1934, '3 feet')  # as namedtuple
> person
| Person(name='Donald Duck', appeared=1934, height='3 feet')
> person.appeared  # short and clear
| 1934
> person[1] # still possible
| 1934
```
Counter – dictionaries for counting

```
> from collections import Counter
> fq = Counter('abracadabra')   # create new counter from a sequence
> fq
| Counter({'a': 5, 'b': 2, 'r': 2, 'c': 1, 'd': 1})   # frequencies of the letters
> fq['a']
| 5
> fq.most_common(3)
| [('a', 5), ('b', 2), ('r', 2)]
> fq['x'] += 5   # increase count of 'x', also valid if 'x' not in Counter yet
> Counter('aaabbbcc') - Counter('aabdd')   # counters can be subtracted
| Counter({'b': 2, 'c': 2, 'a': 1})
> Counter([1, 2, 1, 3, 4, 5]) + Counter([3, 3, 3])   # counters can be added
| Counter({3: 4, 1: 2, 2: 1, 4: 1, 5: 1})

> T = 'AfD adsf dsa f dsaf daf dsaf DSA fda f SA dsa f dsa fdsa f dsAf sAf f dsaf'
> Counter(T.lower().split()).most_common(3)
| [('f', 5), ('dsa', 4), ('dsaf', 4)]
```
Handin 3 & 4 – Triplet distance (Dobson, 1975)

```
((('A','F'),'B'),('D',('C','E')))        (((('D','A'),'B'),'F'),('C','E'))

              (a)                                    (b)

              /\                                     /\
             /  \                                   /  \
            /    \                                 /    \
           /      \                               /      \
          /        \                             /        \
         /\         /\           How similar    /\         /\
        /  \       /  \           are the      /  \       /  \
       /\   \     /    \          trees ?     /    \     'C'   'E'
      /  \  'B' 'D'    /\                     /\    'F'
     'A' 'F'          /  \                   /  \
                    'C'   'E'               /\   'B'
                                           /  \
                                         'D'   'A'
```

Handin 3 & 4 – Triplet distance (Dobson, 1975)

Consider all $\binom{n}{3}$ subsets of size three, and count how many do not have identical substructure (topology) in the two trees.
